

Designation: F1231 – 14

Standard Guide for Ecological Considerations for the Use of Oil Spill Dispersants in Freshwater and Other Inland Environments, Rivers and Creeks¹

This standard is issued under the fixed designation F1231; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This guide covers the use of oil spill dispersants to assist in the control of oil spills. This guide is written with the goal of minimizing the environmental impacts of oil spills; this goal is the basis on which the recommendations are made. Aesthetic and socioeconomic factors are not considered, although these and other factors are often important in spill response.

1.2 Spill responders have available several means to control or clean up spilled oil. In this guide, the use of dispersants is given equal consideration with other spill countermeasures. It is not considered as “last resort” after all other methods have failed.

1.3 This is a general guide only. Oil, as used in this guide, includes crude oils and refined petroleum products. Differences between individual dispersants or between different oil products are not considered.

1.4 This guide is organized by habitat type, for example, small ponds and lakes, rivers and streams, and land. It considers the use of dispersants primarily to protect habitats from impact (or to minimize impacts).

1.5 This guide applies only to freshwater and other inland environments. It does not consider the direct application of dispersants to subsurface waters.

1.6 In making dispersant use decisions, appropriate government authorities should be consulted as required by law.

1.7 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

¹ This guide is under the jurisdiction of ASTM Committee F20 on Hazardous Substances and Oil Spill Response and is the direct responsibility of Subcommittee F20.13 on Treatment.

Current edition approved March 1, 2014. Published March 2014. Originally approved in 1989. Last previous edition approved in 2008 as F1231 – 08. DOI: 10.1520/F1231-14.

3. Significance and Use

3.1 This guide is meant to aid local and regional response teams who may use it during spill response planning and spill events.

3.2 This guide should be adapted to site-specific circumstances.

4. Environment Covered—Rivers and Creeks

4.1 Rivers and creeks are moving bodies of fresh water that are a significant part of major water systems. They have a dynamic near-shore ecology and a wide variety of animal and plant species. In northern regions, these water bodies may be partly or completely ice covered during part of the year. Shallow rivers and most creeks may freeze to the bottom in the winter. Commercially important fishing and recreational activities are frequently associated with these water bodies.

4.2 Rivers generally refer to large bodies of moving water, whereas creeks are smaller bodies of flowing water.

4.3 The characteristics of these water bodies are:

4.3.1 Flowing water,

4.3.2 Water depths in excess of 1 m is designated as a river, shallower would be a creek,

4.3.3 A low organic content bottom except in shallow near shore still-water areas,

4.3.4 Acidic water in some areas especially near industrial regions,

4.3.5 A well defined source or outlet, or both, and

4.3.6 A well defined shoreline consisting of sand beaches and rocky headlands similar to marine and lake environments.
