Designation: F2924 – 14

Standard Specification for Additive Manufacturing Titanium-6 Aluminum-4 Vanadium with Powder Bed Fusion[1]

This standard is issued under the fixed designation F2924; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers additively manufactured titanium-6aluminum-4vanadium (Ti-6Al-4V) components using full-melt powder bed fusion such as electron beam melting and laser melting. The components produced by these processes are used typically in applications that require mechanical properties similar to machined forgings and wrought products. Components manufactured to this specification are often, but not necessarily, post processed via machining, grinding, electrical discharge machining (EDM), polishing, and so forth to achieve desired surface finish and critical dimensions.

1.2 This specification is intended for the use of purchasers or producers, or both, of additively manufactured Ti-6Al-4V components for defining the requirements and ensuring component properties.

1.3 Users are advised to use this specification as a basis for obtaining components that will meet the minimum acceptance requirements established and revised by consensus of the members of the committee.

1.4 User requirements considered more stringent may be met by the addition to the purchase order of one or more Supplementary Requirements, which may include, but are not limited to, those listed in S1-S16.

1.5 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.6 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 *Definitions:*

3.1.1 *as built, n, adj*—refers to the state of components made by an additive process before any post processing except where removal from a build platform is necessary or powder removal or support removal is required.

3.1.2 *build cycle, n*—single cycle in which one or more components are built up in layers in the process chamber of the machine.

3.1.3 *heat, n*—powder lot.

3.1.4 *manufacturing lot, n*—manufactured components having commonality between powder, production run, machine, and post-processing steps (if required) as recorded on a single manufacturing work order.

[7] Available from National Institute of Standards and Technology (NIST), 100 Bureau Dr., Stop 1070, Gaithersburg, MD 20899-1070, http://www.nist.gov.

3.1.5 *machine, n*—a system including hardware, machine control software, required set-up software and peripheral accessories necessary to complete a build cycle for producing components.

3.1.6 *manufacturing plan, n*—plan including, but not limited to the items in Section 6, written by the component supplier that specifies the production sequence, machine parameters and manufacturing control system used in the production run.

3.1.6.1 *Discussion*—Manufacturing plans are typically required under a quality management system such as ISO 9001 and ASQ C1.

3.1.7 *near net shape, n*—components that meet dimensional tolerance as built with little post processing.

3.1.7.1 *Discussion*—Near net shape components are typically used for, but not limited to, Class 4 components.

3.1.8 *powder bed, n*—refers to the build area in an additive manufacturing process in which feedstock is deposited and selectively melted with a heat source to build up components.

3.1.8.1 *Discussion*—Powder bed processes are in contrast to other metal additive manufacturing processes in which powder or wire are fed simultaneously with the heat source. Powder bed processes include, but are not limited to, the processes know as selective laser melting, metal laser sintering, and electron beam melting.

3.1.9 *powder blend, n*—quantity of powder made by blending powders originating from more than one powder lot.

3.1.10 *powder lot, n*—a quantity of powder produced under traceable, controlled conditions, from a single unifying manufacturing process cycle and provided with source documentation.

3.1.10.1 *Discussion*—The size of a powder lot is defined by the powder supplier. It is common that the powder supplier distributes a portion of a powder lot to multiple powder bed fusion component suppliers.

3.1.11 *production run, n*—all components produced in one build cycle or sequential series of build cycles using the same process conditions and powder.

3.1.12 *used powder, n*—powder from a powder blend or powder lot that has been processed in at least one previous build cycle.

3.1.13 *virgin powder, n*—unused powder from a single powder lot.

3.2 Terminology relating to titanium microstructure in AS1814 shall apply.

3.3 Terminology relating to additive manufacturing in Terminology F2792 shall apply.

3.4 Terminology relating to coordinate systems in Terminology 52921 shall apply.

3.5 Terminology relating to powder metallurgy in Terminology B243 shall apply.

4. Classification

4.1 Unless otherwise specified herein, all classifications shall meet the requirements in each section of this specification.

4.1.1 Class A components shall be stress relieved or annealed per Section 12.

4.1.2 Class B components shall be annealed per Section 12.

4.1.3 Class C components shall be hot isostatically pressed per Section 13.

4.1.4 Class D components shall be solution heat treated and aged per Section 12.

4.1.5 For Class E components all thermal processing shall be optional.

4.1.6 Class F components shall be stress relieved or annealed per Section 12.

5. Ordering Information

5.1 Orders for components compliant with this specification shall include the following to describe the requirements adequately:

5.1.1 This specification designation,

5.1.2 Description or part number of product desired,

5.1.3 Quantity of product desired,

5.1.4 Classification,

5.1.5 SI or SAE units,

5.1.5.1 *Discussion*—The STL file format used by many powder bed fusion machines does not contain units of measurement as metadata. When only STL files are provided by the purchaser, ordering information should specify the units of the component along with the electronic data file. More information about data files can be found in ISO/ASTM 52915.

5.1.6 Dimensions and tolerances (Section 14),

5.1.7 Mechanical properties (Section 11),

5.1.8 Methods for chemical analysis (Section 9),

5.1.9 Sampling methods (S16),

5.1.10 Post-processing sequence of operations,

5.1.11 Thermal processing,

5.1.12 Allowable porosity (Section S8).

5.1.13 Component marking such as labeling the serial or lot number in the CAD file prior to the build cycle, or product tagging,

5.1.14 Packaging,

5.1.15 Certification,

5.1.16 Disposition of rejected material (Section 15), and

5.1.17 Supplementary requirements.

6. Manufacturing Plan

6.1 Class A, B, C, D, and F components manufactured to this specification shall have a manufacturing plan that includes, but is not limited to, the following:

6.1.1 A machine, and manufacturing control system, qualification procedure as agreed between component supplier and purchaser;

NOTE 1—Qualification procedures typically require qualification build cycles in which mechanical property test specimens are prepared and measured in accordance with Section 11 or other applicable standards. Location, orientation on the build platform, number of test specimens for each machine qualification build cycle, and relationship between specimen test results and component quality shall be agreed upon between component supplier and purchaser.

6.1.2 Feedstock that meets the requirements of Section 7;

6.1.3 The machine identification, including machine software version, manufacturing control system version (if

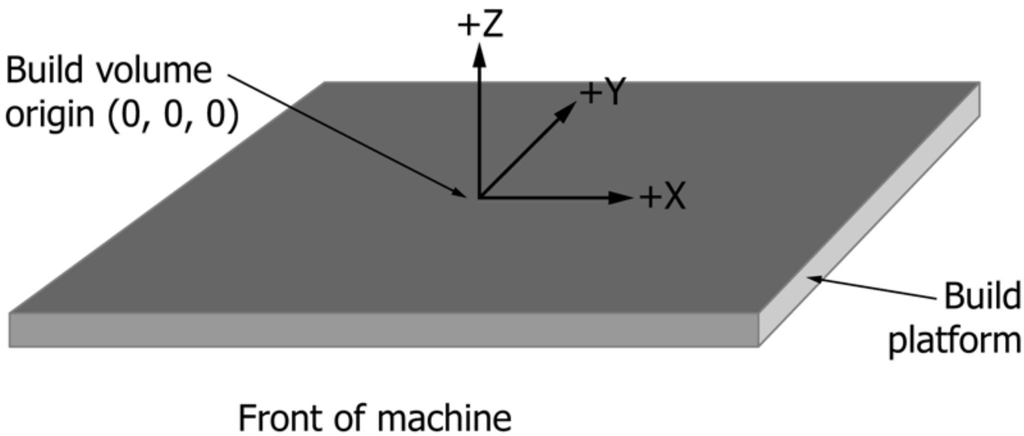

FIG. 1 Build Platform Coordinates for Test Specimens (for reference only)

automated), build chamber environment, machine conditioning, and calibration information of the qualified machine;

6.1.4 Predetermined process as substantiated by the qualification procedure;

6.1.5 Safeguards to ensure traceability of the digital files, including design history of the components;

6.1.6 All the steps necessary to start the build process, including build platform selection, machine cleaning, and powder handling;

6.1.7 The requirements for approving machine operators;

6.1.8 Logging of machine build data files, upper and lower limits of the parameters affecting component quality and other process validation controls;

6.1.9 The number of components per build cycle, their orientation and location on the build platform, and support structures, if required;

6.1.10 Process steps including, but not limited to, Section 8;

6.1.11 Post-processing procedure, including sequence of the post-processing steps and the specifications for each step;

6.1.12 Thermal processing including furnace anneal, hot isostatic pressing, heat treat, and aging; and

6.1.13 Inspection requirements as agreed between the purchaser and component supplier, including any supplementary requirements.

7. FeedStock

7.1 The feedstock for this specification shall be metal powder, as defined in Terminology B243, that has the powder type, size distribution, shape, tap density, and flow rate optimized for the process as determined by the component supplier.

7.2 The metal powder shall be free from detrimental amounts of inclusions and impurities and its chemical composition shall be adequate to yield, after processing, the final material chemistry listed in Table 1.

7.3 Powder blends are allowed unless otherwise specified between the component supplier and component purchaser, as long as all powder used to create the powder blend meet the requirements in Table 1 and lot numbers are documented and maintained.

TABLE 1 Composition

Element	min	max
Aluminum	5.50	6.75
Vanadium	3.50	4.50
Iron	—	0.30
Oxygen	—	0.20
Carbon	—	0.08
Nitrogen	—	0.05
Hydrogen	—	0.015
Yttrium	—	0.005
Other elements, each	—	0.10
Other elements, total	—	0.40
Titanium	remainder	

7.4 Used powder is allowed. The proportion of virgin powder to used powder shall be recorded and reported for each production run. The maximum number of times used powder can be used as well as the number of times any portion of a powder lot can be processed in the build chamber should be agreed upon between component supplier and purchaser for Class A, B, C, D, and F. There are no limits on the number of build cycles for used powder for Class E components. After a build cycle, any remaining used powder may be blended with virgin powder to maintain a powder quantity large enough for next build cycle. The chemical composition of used powders shall be analyzed regularly, as agreed upon between component supplier and purchaser. Powder not conforming to Table 1 or 7.7 shall not be further processed in the machine to manufacture Class A, B, C, D and F components.

7.4.1 All used powder shall be sieved with a sieve having a mesh size appropriate for removing any agglomerates or contaminants from the build cycle.

7.5 All powder sieves used to manufacture Class A, B, C, D and F components shall have a certificate of conformance that they were manufactured to ISO 9044 or all powder sieving shall be in conformance with Specification E11.

7.6 Sieve analysis of used powder or powder lots during incoming inspection or in-process inspection shall be made in accordance with Test Method B214 or as agreed between component supplier and purchaser.

7.7 The maximum percentage of aluminum in Table 1 may be increased for virgin powder, used powder and powder
