Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO ~~had~~/had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

IULTCS, originally formed in 1897, is a world-wide organization of professional leather societies to further the advancement of leather science and technology. IULTCS has three Commissions, which are responsible for establishing international methods for the sampling and testing of leather. ISO recognizes IULTCS as an international standardizing body for the preparation of test methods for leather.

This document was prepared by the Physical Test Commission of the International Union of Leather Technologists and Chemists Societies (IUP Commission, IULTCS) in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 289, *Leather*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This third edition cancels and replaces the second edition (ISO 3379:2015), which has been technically revised.

The main changes are as follows:

- ~~the~~ terminology and references are modified to be in line with ISO 2418:2023;
- [Clause 6](#) ~~Clause 6~~ has been re-arranged to make it easier to follow.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Leather — Determination of distension and strength of surface (Ball burst method)

1 Scope

This document specifies a test method for the determination of distension and strength of the leather grain or finished surface. This method is applicable to all flexible leathers and it is particularly suitable to determine the lastability of leathers for footwear uppers.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 2418, *Leather — Chemical, physical, mechanical and fastness tests — Position and preparation of specimens for testing*

ISO 2419, *Leather — Physical and mechanical tests — Specimen and test piece conditioning*

ISO 2589, *Leather — Physical and mechanical tests — Determination of thickness*

ISO 15115, *Leather — Vocabulary*

EN 15987, *Leather — Terminology — Key definitions for the leather trade*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 15115, EN 15987 and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1 wearing surface

exposed or visible face of the leather when used in its intended application

Note 1 to entry: The wearing surface is usually the grain side of leather, however, the wearing surface of some leathers may be otherwise dressed or finished, e.g. patent leather.

3.2 reverse side

opposite side to the *wearing surface* [\[3.1\(3-1\)\]](#)

Note 1 to entry: The reverse side is usually the flesh side of leather.

3.3
crack

small surface splits or tears less than approximately 0,5 mm

3.4
burst

complete rupture of the full thickness of the test piece

3.5
lastability

ability of a material to be stretched simultaneously in all directions (distended) without being damaged

4 Principle

A circular test piece is clamped around its edge and is gradually distended by forcing a steel metal ball, attached to the end of a plunger, against the centre of the test piece on the reverse side. At certain distension, measured in terms of distance travelled by the plunger, cracks appear on the wearing surface of the test piece or it sustains other permanent physical damage; this distension is recorded as the cracking point or first damage. At a higher distension, the material usually bursts and this distension may also be recorded.

5 Apparatus and material

5.1 Test machine, incorporating the following (see [Figure 1](#) ~~Figure 1~~).

NOTE Source of apparatus is provided in [Annex A](#) ~~Annex A~~.

5.1.1 Clamp, for holding securely the test piece around its edge, leaving a central circular aperture of diameter 25,0 mm ± 0,5 mm. The design of the clamping system of the machine shall ensure that the test piece does not slip during the test and shall neither stretch nor compress the central area of the test piece as it is clamped.

NOTE To ensure that the test piece does not slip in the clamp during the test, it can be necessary to add some interlocking profile, serrations, or other mechanical intervention to the face of the top and bottom clamps.

5.1.2 Moveable plunger, with a hemispherical end, nominal diameter 6,25 mm ± 0,05 mm.

5.1.3 Means of moving the plunger, without rotation, against the centre of the test piece and in a direction normal to the plane occupied by the test piece when it is clamped, at a speed of 0,20 mm/s ± 0,05 mm/s.

5.1.4 Means of monitoring and recording distension of the leather, or travel of the plunger from zero, in a direction normal to the plane occupied by the test piece with an accuracy of ±0,05 mm.

5.1.5 Means of monitoring and recording the force on the plunger with an accuracy of ±10 N.
