Designation: F2026 – 14

StandardSpecification for Polyetheretherketone (PEEK) Polymers for Surgical Implant Applications[1]

This standard is issued under the fixed designation F2026; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers polyetheretherketone (PEEK) polymer in virgin forms as supplied by a vendor (pellets, powder, fabricated forms, and so forth). It provides requirements and associated test methods for these thermoplastics when they are to be used in the manufacture of intracorporeal devices such as surgical implants or components of surgical or dental devices.

1.2 The properties included in this specification are those applicable for PEEK polymers only. Indicated properties are for fabricated forms. Materials or forms containing colorants, fillers, processing aids, or other additives, as well as polymer blends which contain PEEK, or reclaimed materials, are not covered by this specification.

1.3 This specification is designed to recommend physical, chemical, and biological test methods to establish a reasonable level of confidence concerning the performance of virgin PEEK polymers for use in medical implant devices.

1.4 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.5 When evaluating material in accordance with this specification, hazardous materials, operations, and equipment may be involved. *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 *Definitions of Terms Specific to This Standard:*

[1] This specification is under the jurisdiction of ASTM Committee F04 on Medical and Surgical Materials and Devices and is the direct responsibility of Subcommittee F04.11 on Polymeric Materials.

Current edition approved March 1, 2014. Published May 2014. Originally approved in 2000. Last previous edition approved in 2012 as F2026 – 12. DOI: 10.1520/F2026-14.

3.1.1 *fabricated forms, n*—those items into which the virgin forms may be converted. These include shapes and forms produced by means of machining, extruding, and compression molding virgin forms into a subsequent entity (for example, fibers, tubes, rods, slabs, sheets, film, or complex shaped parts and devices).

3.1.2 *formulated compound, n*—materials, parts, or devices fabricated from virgin forms in such a way as to contain intentional or unintentional adjuvant substances.

3.1.3 *virgin forms, n*—the initially delivered form of the polymer as synthesized from its monomers prior to any processing or fabrication into a medical device. The provided resin is typically in the form of pellets, granules, or powder and is the material from which fibers, tubes, rods, slabs, sheets, films, or specific parts and devices are fabricated.

4. Classification

4.1 The PEEK polymer in the scope of this specification is a pure semicrystalline homopolymer consisting of phenylene rings connected by ether (E) and carbonyl (or ketone, K) groups along the polymer chain (see Appendix X1). Its polymeric structure is defined by the repeating unit EEK.

4.2 Types of PEEK plastics, molding, and extrusion grades are described in Classification System D4000.

5. Properties

5.1 The properties listed below shall be considered in selecting material(s) in accordance with the specific end-use requirements.

5.2 The infrared spectrum[5] of these materials is characteristic of their molecular repeating units. A representative spectrum is listed in Appendix X3. The PEEK polymer shall yield an infrared spectrum, which exhibits major bands only at the wavelengths listed for a standard reference spectrum of that material.

5.2.1 The infrared spectrum, as used in this specification, is to identify the specific type of poly aryl ether ketone (PAEK) present and does not necessarily indicate an acceptable degree of material purity.

5.2.2 The presence of additional bands in the sample's infrared spectrum compared to that of the reference material may indicate a different PAEK or impurities, or both.

5.3 The physical and chemical property requirements for the virgin polymer are listed in Table 1. If additional characteristics are necessary because of a specific application, the procedures referenced in Section 2 are recommended, or as agreed upon between the vendor and the purchaser.

5.4 The viscosity requirements will vary depending upon the grade and test method. The method and requirements shall be agreed upon between the vendor and the purchaser.

5.5 The chemical, physical, and mechanical properties of fabricated forms are related to the processes utilized in producing the fabricated form (for example, molding, machining, sterilization, and so forth). Additionally, the properties necessary for a particular device to perform properly will vary from one device type to another. Table 2 lists some typical properties of non-sterilized fabricated forms.

5.6 Test specimens shall be fabricated (machined, injection molded, and so forth) from the virgin polymer, or finished part, in such a way as to effectively represent the material characteristics of the non-sterilized finished part.

5.6.1 As with any material, some characteristics may be altered by the processing techniques (for example, molding, extrusion, machining, assembly, and sterilization) required for the production of a specific part or device. Therefore, properties of fabricated forms of these polymers should be evaluated using test methods which are appropriate to ensure safety and efficacy as agreed upon by the vendor, purchaser, and regulating bodies.

5.7 Tests and test procedures shall be such as to ensure a high level of control and characterization of the virgin polymer as received from the supplier. The test methods referenced in Section 2 may be appropriate (Test Methods D648 and D695).

TABLE 1 Required Properties of Virgin Resin

Parameter	Method	Requirement
Glass transition temperature, T_g (°C)	DSC,[A] 20°K/min, sealed sample, T_g taken on second reheat, D3418	125 - 165
Melt temperature, T_m (°C)	DSC, 20°K/min, sealed sample, T_m taken as max point on reheat endotherm, D3418	320 - 360
Recrystallization temperature, T_c (°C)	DSC, 20°K/min, sealed sample, T_c taken as max point on cooling exotherm, D3418	260 - 320
Viscosity	As agreed per 5.4	As agreed per 5.4
Infrared spectrum	As agreed per 5.2	As agreed per 5.2
Total heavy metals as lead, max, %	US Pharmacopeia, Test 231	<0.1

[A] Differential Scanning Calorimetry (DSC).
