

Designation: A904 – 14

Standard Specification for 50 Nickel-50 Iron Powder Metallurgy Soft Magnetic Parts¹

This standard is issued under the fixed designation A904; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reappraisal. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reappraisal.

1. Scope

1.1 This specification covers the magnetic properties of 50 nickel-50 iron parts fabricated by powder metallurgy techniques and is intended for parts that require high magnetic permeability, high electrical resistivity, low coercive field strength, and low hysteresis loss. It differs from the wrought alloy specification (see Specification [A753](#)) because these parts are porous. A number of magnetic properties such as permeability are proportional to the sintered density.

1.2 This specification deals with powder metallurgy parts in the sintered or annealed condition. Should the sintered parts be subjected to any secondary operation that causes mechanical strain, such as machining or sizing, they should be resintered or annealed.

1.3 The values stated in customary (cgs-emu and inch-pound) units are to be regarded separately as standard. The values given in parentheses are mathematical conversions to SI units, which are provided for information only and are not considered standard.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 The terms and symbols used in this specification are defined in Terminology [A340](#).

4. Ordering Information

4.1 Orders for parts conforming to this specification shall include the following information.

4.1.1 Reference to this standard and year of issue/revision.

4.1.2 Reference to an applicable part drawing. [14](#)

4.1.3 Quantity required.

4.1.4 A critical cross section of the part shall be defined and so indicated on the applicable part drawing. The location of the critical section is by mutual agreement between the user and producer (see [6.2](#)).

4.1.5 Magnetic property requirements if they are other than stated in [7.5](#).

4.1.6 Certification of chemical composition or magnetic property evaluation, or both (Sections [5](#) and [7](#)).

4.1.7 Marking and packaging requirements (Section [12](#)).

4.1.8 Exceptions to this specification or special requirements such as functional testing as mutually agreed upon by the producer and user.

5. Chemical Composition

5.1 The chemical composition of the parts shall conform to the requirements prescribed in [Table 1](#).
