

Designation: **A568/A568M – 13a^{e1} A568/A568M – 14**

Standard Specification for Steel, Sheet, Carbon, Structural, and High-Strength, Low- Alloy, Hot-Rolled and Cold-Rolled, General Requirements for¹

This standard is issued under the fixed designation A568/A568M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the U.S. Department of Defense.

^{e1} NOTE—Table X2.3 was editorially updated in October 2013.

1. Scope*

1.1 This specification covers the general requirements for steel sheet in coils and cut lengths. It applies to the following specifications that describe carbon steel, structural steel, and high-strength, low-alloy steel (HSLA) furnished as hot-rolled sheet and cold-rolled sheet: Specifications [A414/A414M](#), [A424](#), [A606](#), [A659/A659M](#), [A794](#), [A1008/A1008M](#), [A1011/A1011M](#), and [A1039/A1039M](#).

1.2 This specification is not applicable to hot-rolled heavy-thickness carbon sheet coils (Specification [A635/A635M](#)).

1.3 In case of any conflict in requirements, the requirements of the individual material specification shall prevail over those of this general specification.

1.4 For the purposes of determining conformance with this and the appropriate product specification referenced in [1.1](#), values shall be rounded to the nearest unit in the right hand place of figures used in expressing the limiting values in accordance with the rounding method of Practice [E29](#).

1.5 [Annex A1](#) lists permissible variations in dimensions and mass (see [Note 1](#)) in SI [metric] units. The values listed are not exact conversions of the values listed in the inch-pound tables, but instead are rounded or rationalized values. Conformance to [Annex A1](#) is mandatory when the “M” specification is used.

NOTE 1—The term *weight* is used when inch-pound units are the standard. However, under SI the preferred term is *mass*.

1.6 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

1.7 This specification and the applicable material specifications are expressed in both inch-pound units and SI units. However, unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

Fed. Std. No. 123 Marking for Shipments (Civil Agencies)

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 Steel Types:

3.1.2 carbon steel—*steel, n*—designation for steel when no minimum content is specified or required for aluminum, chromium, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, zirconium, or any element added to obtain a desired alloying effect; when the specified minimum for copper does not exceed 0.40 %; or when the maximum content specified for any of the following elements does not exceed the percentages noted: manganese 1.65, silicon 0.60, or copper 0.60.

³ The last approved version of this historical standard is referenced on www.astm.org.

⁴ Available from Standardization Documents Order Desk, DODSSP, Bldg. 4, Section D, 700 Robbins Ave., Philadelphia, PA 19111-5098, <http://www.dodssp.daps.mil>.

<https://standards.iteh.ai/catalog/standards/sist/8b61b749-041f-4dbe-b52e-181fab367a33/astm-a568-a568m-14>

3.1.2.1 Discussion—

In all carbon steels small quantities of certain residual elements unavoidably retained from raw materials are sometimes found which are not specified or required, such as copper, nickel, molybdenum, chromium, etc.—and so forth. These elements are considered as incidental and are not normally determined or reported.

3.1.3 high-strength, low-alloy steel—*steel, n*—specific group of steels in which higher strength, and in some cases additional resistance to atmospheric corrosion or improved formability, are obtained by moderate amounts of one or more alloying elements.

3.1.4 Product Types:

3.1.5 hot-rolled sheet—*sheet, n*—manufactured by hot rolling slabs in a continuous mill to the required thickness and can be supplied in coils or cut lengths as specified.

(1) Hot-rolled carbon steel sheet is commonly classified by size as follows:

Width, in. All Widths ^A	Coils and Cut Lengths	Thickness, in. 0.027 to 0.230, excl
---------------------------------------	-----------------------	--

^A Hot-rolled sheet in coils and cut lengths less than 12 in. in width must have cut edges. Hot-rolled material with mill edges 12 in. and less in width is considered hot-rolled strip.

Width, mm All Widths ^A	Coils and Cut Lengths	Thickness, mm 0.7 to 6.0, excl
--------------------------------------	-----------------------	-----------------------------------

^A Hot-rolled sheet in coils and cut lengths less than 300 mm. in width must have cut edges. Hot-rolled material with mill edges 300 mm and less in width is considered hot-rolled strip.

(2) Hot-rolled high-strength low-alloy steel sheet is commonly classified by size as follows:

Width, in.
All Widths^A

Coils and Cut Lengths

Thickness, in.
0.031 to 0.230, excl

^A Hot-rolled sheet in coils and cut lengths less than 12 in. in width must have cut edges. Hot-rolled material with mill edges 12 in. and less in width is considered hot-rolled strip.

Width, in.
All Widths^A

Coils and Cut Lengths

Thickness, mm
0.8 to 6.0, excl

^A Hot-rolled sheet in coils and cut lengths less than 300 mm in width must have cut edges. Hot-rolled material with mill edges 300 mm and less in width is considered hot-rolled strip.

NOTE 2—The changes in width limits with the publication of A568/A568M – 06a result in a change in tensile testing direction for material from 0.180 in. [4.5 mm] to 0.230 in. exclusive [6.0 mm exclusive] over 48 in.–48 in. [1200 mm] wide. Material formerly tested in the transverse direction will be tested in the longitudinal direction. This is expected to result in some changes in reported properties. The purchaser is advised to discuss this change with the supplier.

3.1.6 ~~cold-rolled sheet~~—*sheet, n*—manufactured from hot-rolled descaled coils by cold reducing to the desired thickness, generally followed by annealing to recrystallize the grain structure. If the sheet is not annealed after cold reduction it is known as full hard with a hardness of 84 HRB minimum and can be used for certain applications where ductility and flatness are not required.

(1) Cold-rolled carbon sheet is commonly classified by size as follows:

Width, in.	Thickness, in.
All Widths ^{A,B}	Through 0.142
Width, mm	Thickness, mm
All Widths ^{A,B}	Through 4.0

^A Cold-rolled sheet coils and cut lengths, slit from wider coils with cut edge (only) and in thicknesses through 0.142 in. [4.0 mm] carbon 0.25 % maximum by cast analysis.

^B When no special edge or finish (other than matte, commercial bright, or luster finish) or single strand rolling of widths, or both under 24 in. [600 mm] is not specified or required.

(2) Cold-rolled high-strength (low-alloy) sheet is commonly classified by size as follows:

Width, in.	Thickness, in.
Through 12 ^A	0.019 through 0.082
Over 12 ^B	0.020 and over
Width, mm	Thickness, mm
To 300, incl ^A	0.5 to 2.0, incl
Over 300 ^B	0.5 and Over

^A Cold-rolled sheet coils and cut lengths, slit from wider coils with cut edge (only) and in thicknesses 0.019 in. [0.5 mm] through 0.082 in. [2.0 mm] carbon 0.25 % maximum by cast analysis.

^B When no special edge or finish (other than matte, commercial bright, or luster finish) or single strand rolling of widths, or both under 24 in. [600 mm] is not specified or required.

3.1.6.1 Discussion—

Steel products are available in various thickness, width, and length combinations depending upon equipment and processing capabilities of various manufacturers and processors. Historic limitations of a product based upon dimensions (thickness, width, and length) do not take into account current production and processing capabilities. To qualify any product for a particular product specification requires all appropriate and necessary tests be performed and that the results meet the limits prescribed in that product specification. If the necessary tests required by a product specification cannot be conducted, the product cannot be qualified to that specification. This general requirements specification contains permitted variations for the commonly available sizes. Permitted variations for other sizes are subject to agreement between the customer and the manufacturer or processor, whichever is applicable.

3.1.7 *retests, n*—additional test, or tests, made from the original material when the original test did not meet the appropriate acceptance criteria required by a product specification and the failure was mechanical in nature as described in Section 11.

3.1.8 *resample, n*—additional test or tests made when the test on the original sample did not meet the appropriate acceptance criteria required by the product specification, but possibly requiring that the material in question have an appropriate amount discarded prior to securing the new sample or samples.

3.1.9 *steel manufacturer, n*—the organization that directly controls or is responsible for the melting and refining of steel and the conversion of that steel into semifinished steel products known as slabs either through continuous casting, conventional or compact methods, or ingot casting and subsequent conversion of the ingots to slabs, and for one or more additional operations such as testing, marking, loading for shipment, and certification.

3.1.10 *coil processor*—*processor, n*—the organization that directly controls or is responsible for operations involved in processing the coil such as leveling, cutting to length, testing, inspection, blanking, slitting, pickling, cold rolling (cold reduction), heat treating, temper rolling, coating, packaging, marking, loading for shipment, and certification.

3.1.10.1 *Discussion*—

The processing operations need not be controlled by the organization that hot rolls the slab into a coil. If only one organization controls or is responsible for (or both) the hot rolling and processing operations, that organization is termed the manufacturer. If more than one organization controls or is responsible for (or both) hot rolling and processing operations, the organization that controls and is responsible for the hot rolling is termed the hot roll manufacturer and the organization or organizations controlling and responsible for the processing operations is/are termed the processor or processors. Likewise, one organization may be the manufacturer of the hot roll coil and another the manufacturer of the cold roll coil. In such case, the organization responsible for the conversion of the hot roll coil to a cold roll coil and other processing operations will also be termed the cold roll manufacturer and organizations performing additional processing operations to the cold roll coil will be termed the coil processor or coil processors.

3.1.11 *hot roll manufacturer, n*—the organization that directly controls or is responsible for the conversion of steel slabs, by hot rolling into coils, and for one or more additional operations such as leveling, cutting to length, testing, inspection, blanking, slitting, pickling, cold rolling, heat treating, coating, packaging, marking, loading for shipment, and certification.

3.1.12 *cold roll manufacturer, n*—the organization that directly controls or is responsible for the conversion of hot roll coils into cold roll coils, and for one or more additional operations such as pickling, annealing, temper rolling, slitting, cutting to length, testing, inspection, blanking, coating, packaging, marking, loading for shipment, and certification.

3.2 Refer to Terminology [A941](#) for additional definitions of terms used in this standard.

4. Materials and Manufacture

4.1 Unless otherwise specified, hot-rolled material shall be furnished hot-rolled, not annealed, not pickled.

4.2 Coil breaks, stretcher strains, and fluting can occur during the user's processing of hot-rolled or hot-rolled pickled sheet. When any of these features are detrimental to the application, the manufacturer shall be notified at time of ordering in order to properly process the sheet.

4.3 Cold-rolled carbon steel sheet is available as discussed in [10.2](#), [10.3](#), and in [Table 1](#).

4.4 Unless specified as a full-hard product, cold-rolled sheet is annealed after being cold reduced to thickness. The annealed, cold-rolled sheet can be used as annealed last (dead soft) for unexposed end-use applications. When cold-rolled sheet is used for unexposed applications and coil breaks are a hazard in uncoiling, it may be necessary to further process the material. In this case the manufacturer should be consulted. After annealing, cold-rolled sheet is generally given a light skin pass to impart shape or may be given a heavier skin pass or temper pass to prevent the phenomenon known as stretcher straining or fluting, when formed. Temper passing also provides a required surface texture.

4.5 *Temper Rolling:*

4.5.1 Unless otherwise specified, cold-rolled sheet for exposed applications shall be temper rolled and is usually specified and furnished in the strain free condition as shipped. ~~Seeshipped (see [Appendix X1](#), Effect of Aging of Cold-Rolled Carbon Steel Sheet on Drawing and Forming-).~~

4.5.2 Cold-rolled sheet for unexposed applications may be specified and furnished “annealed last” or “temper rolled.” “Annealed last” is normally produced without temper rolling but may be lightly temper rolled during oiling or rewinding. Unexposed temper-rolled material may be specified strain-free or nonfluting. Where specific hardness range or limit or a specified surface texture is required, the application is considered as exposed.

NOTE 3—Skin-passed sheet is subject to an aging phenomenon (see [Appendix X1](#)). Unless special killed (nonaging) steel is specified, it is to the user's interest to fabricate the sheet as soon as possible, for optimum performance.

5. Chemical Composition

5.1 *Limits:*

5.1.1 The chemical composition shall be in accordance with the applicable product specification. However, if other compositions are required for carbon steel, they shall be prepared in accordance with [Appendix X2](#).

5.1.2 Where the material is used for fabrication by welding, care must be exercised in selection of chemical composition or mechanical properties to assure compatibility with the welding process and its effect on altering the properties.

5.2 *Cast or Heat Analysis:*

5.2.1 An analysis of each cast or heat of steel shall be made by the steel manufacturer to determine the percentage of elements specified or restricted by the applicable specification.

TABLE 1 Cold-Rolled Sheet Steel Class Comparison

	Exposed	Unexposed
Major imperfections:		
Cut lengths	Mill rejects	Mill rejects
Coils	Purchaser accepts within the manufacturer's published standards (policy)	Purchaser accepts within the manufacturer's published standards (policy)
Minor imperfections:		
—Cut lengths	Mill rejections repetitive imperfections. May contain random imperfections which the purchaser accepts within the manufacturer's published standards (policy)	Purchaser accepts all minor imperfections
—Coils	Purchaser accepts within the manufacturer's published standards (policy)	Purchaser accepts all minor imperfections
Finish	Matte unless otherwise specified	Purchaser accepts all finishes
Special oils	May be specified	May not be specified
Thickness, width and length tolerance:		
—Standard	Will be met	Will be met
—Restricted	May be specified	May not be specified
Flatness tolerance:		
—Standard	Will be met	Will be met (temper rolled) Not guaranteed—normally within twice standard (annealed last)
Restricted Squareness	May be specified	May not be specified
Coil wraps	Purchaser accepts within the manufacturer's published standards (policy)	Purchaser accepts all
Coil welds	Purchaser accepts within the manufacturer's published standards (policy)	Purchaser accepts within the manufacturer's published standards (policy)
Outside inspection	May be specified	May not be specified
Special testing	May be specified	May not be specified

Special testing	May be specified	May not be specified

5.2.2 When requested, cast or heat analysis for elements listed or required shall be reported to the purchaser or to his representative. The steel manufacturer, or the hot roll manufacturer, cold roll manufacturer, or processor, if different from the steel manufacturer, is responsible for providing this information to the purchaser or his representative as requested.

5.3 Product, Check, or Verification Analysis:

5.3.1 Non-killed steels such as capped or rimmed steels are not technologically suited to product analysis due to the nonuniform character of their chemical composition and composition; therefore, the tolerances in Table 2 do not apply. Product analysis is appropriate on these types of steel only when misapplication is apparent or for copper when copper steel is specified.

5.3.2 For steels other than non-killed (capped or rimmed), product analysis may be made by the purchaser. The chemical analysis shall not vary from the limits specified by more than the amounts in Table 2. The several determinations of any element in a cast shall not vary both above and below the specified range.

5.4 Sampling for Product Analysis:

5.4.1 To indicate adequately the representative composition of a cast by product analysis, it is general practice to select samples to represent the steel, as fairly as possible, from a minimum number of pieces as follows: 3 pieces for lots up to 15 tons incl, and 6 pieces for lots over 15 tons (see Practice E59).

5.4.2 When the steel is subject to tension test requirements, samples for product analysis may be taken either by drilling entirely through the used tension test specimens themselves, or as covered in 5.4.3.

5.4.3 When the steel is not subject to tension test requirements, the samples for analysis must be taken by milling or drilling entirely through the sheet in a sufficient number of places so that the samples are representative of the entire sheet or strip. The sampling may be facilitated by folding the sheet both ways, so that several samples may be taken at one drilling. Steel subjected to certain heating operations by the purchaser may not give chemical analysis results that properly represent its original composition. Therefore, users must analyze chips taken from the steel in the condition in which it is received from the steel manufacturer.

5.5 Specimen Preparation—Drillings or chips must be taken without the application of water, oil, or other lubricant, and must be free of scale, grease, dirt, or other foreign substances. They must not be overheated during cutting to the extent of causing decarburization. Chips must be well mixed and those too coarse to pass a No. 10 sieve or too fine to remain on a No. 30 sieve are not suitable for proper analysis. Sieve size numbers are in accordance with Specification E11.

5.6 Test Methods—In case a referee analysis is required and agreed upon to resolve a dispute concerning the results of a chemical analysis, the procedure of performing the referee analysis must be in accordance with the latest issue of Test Methods, Practices, and Terminology A751, unless otherwise agreed upon between the manufacturer and the purchaser.

6. Mechanical Properties

6.1 The mechanical property requirements, number of specimens, and test locations, and specimen orientation shall be in accordance with the applicable product specification.

TABLE 2 Tolerances for Product Analysis

Element	Limit, or Maximum of Specified Element, %	Tolerance	
		Under Minimum Limit	Over Maximum Limit
Carbon	to 0.15 incl	0.02	0.03
	over 0.15 to 0.40 incl	0.03	0.04
	over 0.40 to 0.80 incl	0.03	0.05
	over 0.80	0.03	0.06
Manganese	to 0.60 incl	0.03	0.03
	over 0.60 to 1.15 incl	0.04	0.04
	over 1.15 to 1.65 incl	0.05	0.05
Phosphorus	...A	...A	0.01
Sulfur	...A	...A	0.01
Silicon	to 0.30 incl	0.02	0.03
	over 0.30 to 0.60 incl	0.05	0.05
Copper	...A	0.02	...A
Nickel	to 1.00 incl	...A	0.03
Chromium	to 0.90 incl	...A	0.04
Molybdenum	to 0.20 incl	...A	0.01
Vanadium	to 0.10 incl	0.01 ^B	0.01 ^B
Columbium (Niobium)	to 0.10 incl	0.01 ^B	0.01 ^B
Titanium	to 0.15 incl	0.01 ^A	0.01 ^B
Aluminum	to 0.10 incl	0.03 ^C	...A
Nitrogen	to 0.030 incl	0.005	0.005

^A Where an ellipsis (...) appears in the table, the requirements have not been defined.

^B If the minimum of the range is 0.01 %, the under tolerance is 0.005 %.

^C If the minimum of the range is 0.01 %, the under tolerance is 0.005 % and if the minimum of the range is 0.02 %, the under tolerance is 0.01 %.

6.2 Unless otherwise specified in the applicable product specification, test specimens must be prepared in accordance with Test Methods and Definitions [A370](#).

6.3 Mechanical tests shall be conducted in accordance with Test Methods and Definitions [A370](#).

6.4 Bend tests where required shall be conducted in compliance with Test Method ~~Methods~~ [E290](#).

6.5 To determine conformance with the product specification, a calculated value should be rounded to the nearest 1 ksi tensile strength and yield point or yield strength, and to the nearest unit in the right hand place of figures used in expressing the limiting value for other values in accordance with the rounding off method given in Practice [E29](#).

6.6 Structural sheet steels are commonly fabricated by cold bending. There are many interrelated factors that affect the ability of a given steel to cold form over a given radius under shop conditions. These factors include thickness, strength level, degree of restraint, relationship to rolling direction, chemistry, and microstructure. Each of the appropriate product specifications lists in the appendix the suggested minimum inside radius for cold bending. These radii should be used as minima for 90° bends. They presuppose “hard way” bending (bend axis parallel to rolling direction) and reasonably good shop forming practices. Where possible, the use of larger radii or “easy way” bends are recommended for improved performance.

6.7 Fabricators should be aware that cracks may initiate upon bending a sheared or burned edge. This is not considered to be a fault of the steel but is rather a function of the induced cold-work or heat-affected zone.

7. General Requirements for Delivery

7.1 The products covered by this specification are produced to inch-pound or metric decimal thickness only and the appropriate thickness tolerances apply.

7.2 Steel may be produced as ingot-cast or strand-cast. When different grades of strand-cast steel are sequentially cast, identification and separation of the transition material is required.

8. Dimensions, Tolerances, and Allowances

8.1 Dimensions, tolerances, and allowances applicable to products covered by this specification are contained in [Tables 3-20](#) [[Annex A1](#), [Tables A1.1-A1.17](#)]. The appropriate tolerance tables shall be identified in each individual specification.

8.2 The appropriate thickness tolerance tables for measurements taken 3/8 in. [10 mm] from the edge are found in Section S1 of the Supplementary Requirements in this specification. See the appropriate product specification for instructions on how to specify.

8.3 *Flatness Tolerances:*

8.3.1 Standard flatness tolerances are contained in ~~Table 13~~ [Tables 13 and 14](#) and ~~Table 14~~ for hot-rolled sheet and [Table 20](#) for cold-rolled sheet.

8.3.2 Measurement techniques for flatness characteristics are described in Practice [A1030/A1030M](#).

8.3.3 Two alternative methods for flatness determination are the use of I-units and percent steepness. A description of these two alternative methods is contained in Practice [A1030/A1030M](#), as well as [Appendix X5](#).

8.3.3.1 The use of I-units or percent steepness as a flatness standard is subject to negotiation between the purchaser and the producer.

8.3.3.2 Measurement techniques for ~~I-units and I-units~~, percent steepness, and rejection limits are subject to negotiation between the purchaser and the producer.

TABLE 3 List of Tables for Dimensions, Tolerances, and Allowances

Carbon ^A and High-Strength Low-Alloy Steel				
Dimensions	Table No.			
	Hot-Rolled Sheet		Cold-Rolled Sheet	
	Inch-Pound Units	SI Units	Inch-Pound Units	SI Units
Camber tolerances	10	A1.7	10, 19	A1.7, A1.16
Diameter tolerances of sheared circles	9	A1.6	9	A1.6
Flatness tolerances	13, 14	A1.10, A1.11	20	A1.17
Length tolerances	8	A1.5	16, 17	A1.13, A1.14
Out-of-square tolerances	11	A1.8	11	A1.8
Restricted squareness tolerances	12	A1.9	12	A1.9

Thickness tolerances	4, 5, S1.1, S1.2	A1.1, A1.2, S1.4, S1.5	15, S1.3	A1.12, S1.6
Width tolerances of cut edge	7	A1.4	7, 18	A1.4, A1.15
Width tolerances of mill edge	6	A1.3	...	

^A Tolerances for hot-rolled carbon sheet steel with 0.25 % maximum carbon, cast or heat analysis.

TABLE 4 Thickness Tolerances for Hot-Rolled Sheet (Carbon and Structural Steel Only)— $\frac{5}{8}$ -in. (Cut Edge) and 1-in. (Mill Edge) Minimum Edge Distance (Coils and Cut Lengths, Including Pickled)

NOTE 1—Thickness is measured at any point across the width not less than $\frac{5}{8}$ in. from a cut edge and not less than 1 in. from a mill edge. This table does not apply to the uncropped ends of mill edge coils.

NOTE 2—Micrometers used for measurement of thickness shall be constructed with anvils and spindles having minimum diameters of 0.188 in. [4.80 mm]–0.188 in. [4.80 mm]. The tip of the spindle shall be flat, and the tip of the anvil shall be flat or rounded with a minimum radius of curvature of 0.10 in. [2.55 mm]. Micrometers with pointed tips are not suitable for thickness measurements.

NOTE 3—The thickness of material <2 in. wide shall be measured at mid-width.

Specified Width, in.	Specified Ordered Thickness, in. ^A					
	0.027 to 0.051, incl	Over 0.051 to 0.057, incl	Over 0.057 to 0.071, incl	Over 0.071 to 0.098, incl	Over 0.098 to 0.180, excl	0.180 to 0.230, excl
	Thickness Tolerances Over, in., No Tolerance Under ^B					
To 20 incl	0.008	0.008	0.009	0.009	0.010	0.010
Over 20 to 40, incl	0.008	0.008	0.009	0.010	0.010	0.012
Over 40 to 48, incl	0.008	0.009	0.009	0.010	0.012	0.014
Over 48 to 60, incl	... ^C	0.009	0.010	0.010	0.012	0.015
Over 60 to 72, incl	... ^C	0.010	0.010	0.012	0.012	0.016
Over 72	... ^C	... ^C	... ^C	0.012	0.012	0.018

^A The specified thickness range captions apply independent of whether the ordered thickness is stated as a nominal or minimum.

^B The tolerances provided in the table are based on minimum thickness (tolerance over, no tolerance under). For nominal thickness, the tolerance is divided equally over and under.

^C Where an ellipsis (. . .) appears in the table, the requirements have not been defined.

TABLE 5 Thickness Tolerances for Hot-Rolled Sheet (High-Strength, Low-Alloy Steel)— $\frac{5}{8}$ -in. (Cut Edge) and 1-in. (Mill Edge) Minimum Edge Distance (Coils and Cut Lengths, Including Pickled)

NOTE 1—Thickness is measured at any point across the width not less than $\frac{5}{8}$ in. from a cut edge and not less than 1 in. from a mill edge. This table does not apply to the uncropped ends of mill edge coils.

NOTE 2—Micrometers used for measurement of thickness shall be constructed with anvils and spindles having minimum diameters of 0.188 in. [4.80 mm]–0.188 in. [4.80 mm]. The tip of the spindle shall be flat, and the tip of the anvil shall be flat or rounded with a minimum radius of curvature of 0.10 in. [2.55 mm]. Micrometers with pointed tips are not suitable for thickness measurements.

NOTE 3—The thickness of material <2 in. wide shall be measured at mid-width.

Specified Width, in.	Specified Ordered Thickness, in. ^A						
	0.031 to 0.051, incl	Over 0.051 to 0.059, incl	Over 0.059 to 0.070, incl	Over 0.070 to 0.082, incl	Over 0.082 to 0.098, incl	Over 0.098 to 0.180, excl	0.180 to 0.230, excl

^C Where an ellipsis (. . .) appears in the table, the requirements have not been defined.

9. Finish and Condition

9.1 Hot-rolled sheet has a surface with an oxide or scale resulting from the hot-rolling operation. The oxide or scale can be removed by pickling or blast cleaning when required for press-work operations or welding. Hot-rolled and hot-rolled descaled sheet is not generally used for exposed parts where surface is of prime importance.

9.1.1 Hot-rolled sheet can be supplied with mill edges or cut edges as specified. Mill edges are the natural edges resulting from the hot-rolling operation. They do not conform to any particular contour. They may also contain some edge imperfections, the more common types of which are cracked edges, thin edges (feather), and damaged edges due to handling or processing and which should not extend in beyond the ordered width. These edge conditions are detrimental where joining of the mill edges by welding is practiced. When the purchaser intends to shear or to blank, a sufficient width allowance should be made when purchasing to ensure obtaining the desired contour and size of the pattern sheet. The manufacturer may be consulted for guidance. Cut edges are the normal edges which result from the shearing, slitting, or trimming of mill-edge sheet.

**TABLE 6 Width Tolerances^A of Hot-Rolled Mill Edge Sheet (All Designations)
(Coils and Cut Lengths, Including Pickled)**

Carbon	
Specified Width, in.	Tolerances Over Specified Width, in. No Tolerance Under
Over 12 to 14 incl	7/16
Over 14 to 17 incl	1/2
Over 17 to 19 incl	9/16
Over 19 to 21 incl	5/8
Over 21 to 24 incl	11/16
Over 24 to 26 incl	13/16
Over 26 to 30 incl	15/16
Over 30 to 50 incl	1 1/8
Over 50 to 78 incl	1 1/2
Over 78	1 7/8
High-Strength Low-Alloy	
Over 12 to 14 incl	7/16
Over 14 to 17 incl	1/2
Over 17 to 19 incl	9/16
Over 19 to 21 incl	5/8
Over 21 to 24 incl	11/16
Over 24 to 26 incl	13/16
Over 26 to 28 incl	15/16
Over 28 to 35 incl	1 1/8
Over 35 to 50 incl	1 1/4
Over 50 to 60 incl	1 1/2
Over 60 to 65 incl	1 5/8
Over 65 to 70 incl	1 3/4
Over 70 to 80 incl	1 7/8
Over 80	2

^A The above tolerances do not apply to the uncropped ends of mill edge coils (10.1.1.1).

**TABLE 7 Width Tolerances of Hot-Rolled Cut Edge Sheet (All Widths) and Cold-Rolled Sheet (Widths Over 12 in. Only) — (All Only) — (All Designations)^A
(Not Resquared, Coils (Coils and Cut Lengths, Including Pickled)**

Specified Width, in.	Tolerances Over Specified Width, in. No Tolerance Under
To 30 incl ^A	1/8
Over 30 to 48 incl	3/16
Over 48 to 60 incl	1/4
Over 60 to 80 incl	5/16
Over 80	3/8

^A Cold Rolled widths 12 in. and less refer to **Table 18.**)

9.1.1.1 The ends of plain hot-rolled mill-edge coils are irregular in shape and are referred to as uncropped ends. Where such ends are not acceptable, the purchaser’s order should so specify. Processed coils such as pickled or blast cleaned are supplied with square-cut ends.

9.2 Cold-rolled carbon sheet (exposed) is intended for those applications where surface appearance is of primary importance. This class will meet requirements for controlled surface texture, surface quality, and flatness. It is normally processed by the manufacturer to be free of stretcher strain and fluting. Subsequent user roller leveling immediately before fabrication will minimize strain resulting from aging.

9.2.1 Cold-rolled carbon sheet, when ordered for exposed applications, can be supplied in the following finishes:

9.2.1.1 Matte finish is a dull finish, without luster, produced by rolling on rolls that have been roughened by mechanical or chemical means to various degrees of surface texture depending upon application. With some surface preparation matte finish is suitable for decorative painting. It is not generally recommended for bright plating.

TABLE 8 Length Tolerances of Hot-Rolled Sheet (All Designations)
(Cut Lengths Not Resquared, Lengths, Including Pickled)

Specified Length, in.	Tolerances Over Specified Length, in. No Tolerance Under	
	To 15 incl	1/8
Over 15 to 30 incl	1/4	
Over 30 to 60 incl	1/2	
Over 60 to 120 incl	3/4	
Over 120 to 156 incl	1	
Over 156 to 192 incl	1 1/4	
Over 192 to 240 incl	1 1/2	
Over 240	1 3/4	

TABLE 9 Diameter Tolerances of Circles Sheared from Hot-Rolled (Including Pickled) and Cold-Rolled Sheet (Over 12 in. Width) (All Designations)

Specified Thickness, ^A in.	Tolerances Over Specified Diameter, in. (No Tolerances Under)		
	Under 30	Over 30 to 48 incl	Over 48
0.044 to 0.057 incl	1/16	1/8	3/16
Over 0.057 to 0.098 incl	3/32	5/32	7/32
Over 0.098	1/8	3/16	1/4

^A 0.071 in. minimum thickness for hot-rolled high-strength low-alloy steel sheet.

TABLE 10 Camber Tolerances^A for Hot-Rolled (Including Pickled) and Cold-Rolled Sheet (All Designations)
(Cut Lengths, not Resquared)Lengths)

NOTE 1—Camber is the greatest deviation of a side edge from a straight line, the measurement being taken on the concave side with a straightedge.

Cut Length, ft	Camber Tolerances, in.
To 4 incl	1/8
Over 4 to 6 incl	3/16
Over 6 to 8 incl	1/4
Over 8 to 10 incl	5/16
Over 10 to 12 incl	3/8
Over 12 to 14 incl	1/2
Over 14 to 16 incl	5/8
Over 16 to 18 incl	3/4
Over 18 to 20 incl	7/8
Over 20 to 30 incl	1 1/4
Over 30 to 40 incl	1 1/2

^A The camber tolerance for coils is 1 in. in any 20 ft.

9.2.1.2 Commercial bright finish is a relatively bright finish having a surface texture intermediate between that of matte and luster finish. With some surface preparation commercial bright finish is suitable for decorative painting or certain plating applications. If sheet is deformed in fabrication the surface may roughen to some degree and areas so affected will require surface preparation to restore surface texture to that of the undeformed areas.

9.2.1.3 Luster finish is a smooth bright finish produced by rolling on ground rolls and is suitable for decorative painting or plating with additional special surface preparation by the user. The luster may not be retained after fabrication; therefore, the formed parts will require surface preparation to make them suitable for bright plating.

TABLE 11 Out-of-Square Tolerances of Hot-Rolled Cut-Edge (Including Pickled) and Cold-Rolled Sheet (All Designations) (Cut Lengths Not Resquared) Lengths

Out-of-square is the greatest deviation of an end edge from a straight line at right angle to a side and touching one corner. It is also obtained by measuring the difference between the diagonals of the cut length. The out-of-square deviation is one half of that difference. The tolerance for all thicknesses and all sizes is 1/16 in./6 in. of width or fraction thereof.

TABLE 12 Restricted Squareness Tolerances of Hot-Rolled (Including Pickled) and Cold-Rolled Sheet (All Designations) (Cut Lengths)

When cut lengths are specified resquared, the width and the length are not less than the dimensions specified. The individual tolerance for over-width, over-length, camber, or out-of-square should not exceed 1/16 in. up to and including 48 in. in width and up to and including 120 in. in length. For cut lengths wider or longer, the applicable tolerance is 1/8 in.

TABLE 12 Restricted Squareness Tolerances of Hot-Rolled (Including Pickled) and Cold-Rolled Sheet (All Designations) (Cut Lengths)

When cut lengths are specified restricted squareness, the width and the length are not less than the dimensions specified. The individual tolerance for over-width, over-length, camber, or out-of-square should not exceed 1/16 in. up to and including 48 in. in width and up to and including 120 in. in length. For cut lengths wider or longer, the applicable tolerance is 1/8 in.

TABLE 13 Flatness Tolerances^A of Temper Rolled or Pickled Hot-Rolled Sheet Cut Lengths^B (All Designations)

Table with 4 columns: Specified Minimum Thickness, in.; Specified Width, in.; Specified Yield Strength, min, ksi; Flatness Tolerances, C in. (subdivided into Under 45 and 45 to 50 D, E).

A The above table also applies to lengths cut from coils by the consumer when adequate flattening operations are performed. B Application of this table to product in coil form is not appropriate unless the coil has been rolled out and adequately flattened with all coil set removed. C Maximum deviation from a horizontal flat surface. D Tolerances for steels with specified minimum yield strength in excess of 50 ksi are subject to negotiation. E 0.071 minimum thickness of HSLA.

9.3 Cold-rolled carbon sheet, when intended for unexposed applications, is not subject to limitations on degree and frequency of surface imperfections, and restrictions on texture and mechanical properties are not applicable. When ordered as “annealed last,” the product will have coil breaks and a tendency toward fluting and stretcher straining. Unexposed cold-rolled sheet may contain more surface imperfections than exposed cold-rolled sheet because steel applications, processing procedures, and inspection standards are less stringent.

9.4 Cold-rolled high-strength low-alloy sheet is supplied with a matte finish, unless otherwise specified.

9.5 The cold-rolled products covered by this specification are furnished with cut edges and square cut ends, unless otherwise specified.

9.6 Oiling:

9.6.1 Plain hot-rolled sheet is customarily furnished not oiled. Oiling must be specified, when required.
