Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iso.org/www.iso.

ISO and IEC draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO and IEC take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC had received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and https://patents.iec.ch. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 29, *Coding of audio*, *picture*, *multimedia*, *and hypermedia*.

This third edition cancels and replaces the second edition (ISO/IEC 23003-4:2020), which has been technically revised. It also incorporates the Amendments ISO/IEC 23003-4:2020/Amd 1:2022 and ISO/IEC 23003-4:2020/Amd 2:2023.

The main changes are as follows:

 Functionality for side chain normalization and loudness leveling, related reference software, and conformance have been integrated.

A list of all parts in the ISO/IEC 23003 series can be found on the ISO and IEC websites.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iso.org/members.html and www.iso.org/members.html and

Introduction

Consumer audio systems and devices are used in a large variety of configurations and acoustical environments. For many of these scenarios, the audio reproduction quality can be improved by appropriate control of content dynamics and loudness.

This document provides a universal dynamic range control tool that supports loudness normalization. The DRC tool offers a bitrate efficient representation of dynamically compressed versions of an audio signal. This is achieved by adding a low-bitrate DRC metadata stream to the audio signal. The DRC tool includes dedicated sections for clipping prevention, ducking/leveling, and for generating a fade-in and fade-out to supplement the main dynamic range compression functionality. The DRC effects available at the DRC decoder are generated at the DRC encoder side. At the DRC decoder side, the audio signal may be played back without applying the DRC tool, or an appropriate DRC tool effect is selected and applied based on the given playback scenario.

Loudness normalization is fully integrated with DRC and peak control to avoid clipping. A metadata-controlled equalization tool is provided to compensate for playback scenarios that impact the spectral balance, such as downmix or DRC. Furthermore, the DRC tool supports metadata-based loudness equalization to compensate the effect of playback level changes on the spectral balance.

Information technology — MPEG audio technologies —

Part 4:

Dynamic range control

1 Scope

This document specifies technology for loudness and dynamic range control (DRC). It is applicable to most MPEG audio technologies. It offers flexible solutions to efficiently support the widespread demand for technologies such as loudness normalization and dynamic range compression for various playback scenarios.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms, definitions and symbols O/IEC 23003-4:2025

3.1 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 14496-12 and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at https://www.iso.org/obp
- IEC Electropedia: available at https://www.electropedia.org/

3.1.1

DRC sequence

series of DRC gain values that can be applied to one or more audio channels

3.1.2

DRC set

defined set of DRC sequences that produce a desired effect if applied to the audio signal

3.1.3

album

collection of audio recordings that are mastered in a consistent way

Note 1 to entry: Traditionally, a collection of songs released on a Compact Disk belongs into this category, for example.

3.1.4

conformance test bitstream

bitstream used for testing the conformance of MPEG-D DRC compliant audio decoders

3.1.5

conformance test case

conformance test category and a combination of one or more conformance test conditions for which a conformance test sequence is provided

3.1.6

conformance test condition

condition which applies to properties of a conformance test sequence in order to test a certain functionality of the MPEG-D DRC decoder

3.1.7

conformance test criteria

one or more conformance test tools and corresponding parameters applied to verify the conformance for a certain conformance test sequence

3.1.8

conformance test sequence

set of a conformance test bitstream, a decoder setting, an input audio file and a corresponding reference file

3.1.9

decoder input parameters

input parameters that are supplied to an MPEG-D DRC decoder in addition to a conformance test bitstream, a decoder interface bitstream and an input audio file

3.1.10

decoder setting

combination of a decoder interface bitstream and decoder input parameters that are supplied to an MPEG-D DRC decoder

3.1.11

input DRC set selection parameters

input parameter set for testing of a DRC gain decoder instance

Note 1 to entry: This parameter set is solely used for conformance testing in the context of the DRC gain decoder conformance test category (DrcGainDec).

3.1.12

reference audio file

decoded counterpart of a conformance test bitstream, a decoder setting and an input audio file

3.1.13

reference DRC set selection parameters

decoded counterpart of a conformance test bitstream and a decoder setting fed to the DRC set selection process

Note 1 to entry: This parameter set is an intermediate result of an MPEG-D DRC compliant decoder implementation solely used for conformance testing in the context of the DRC selection process test category (DrcSelProc).

3.1.14

reference file

reference audio file or reference DRC set selection parameters

3.2 Symbols

 a_i filter coefficient

b band index of DRC filter bank (starting at 0)

*b*_i filter coefficient

deltaTmin smallest permitted DRC gain sample interval in units of the audio sample interval

 f_c cross-over frequency in Hz

 $f_{c.norm}$ cross-over frequency expressed as fraction of the audio sample rate

 $f_{c.norm.SB}(s)$ cross-over frequency of audio decoder sub-band s expressed as fraction of

the audio sample rate

NOTE 1 The cross-over frequency is the upper band edge frequency of the sub-band.

 $f_{\rm s}$ audio sample rate in Hz

NOTE 2 If an audio decoder is present, it is the sample rate of the decoded time-domain

audio signal.

 $M_{\rm DRC}$ DRC frame size in units of the audio sample interval $1/f_s$

 N_{DRC} maximum permitted number of DRC samples per DRC frame

NOTE 3 Identical to the number of intervals with a duration of *deltaTmin* per DRC

frame.

 N_{Codec} codec frame size in units of the audio sample interval $1/f_s$

π ratio of a circle's circumference to its diameter

s audio decoder sub-band index (starting at 0)

z complex variable of the z-transform

uttps://standards.iteh.ai/catalog/standards/iso/24b46154-a094-4069-ad58-e9fdb8a070ff/iso-jec-23003-4-202;

4 Mnemonics

bild bit string, left bit first, where "left" is the order in which bit strings are written in the

ISO/IEC 14496 series

NOTE Bit strings are written as a string of 1s and 0s within single quote marks, for example '1000 0001'. Blanks within a bit string are for ease of reading and have no

significance.

byte_align() number of bits to fill for byte alignment at the offset of *n* bits:

byte_align(n) = 8 ceil (n/8) – n

uimsbf unsigned integer, most significant bit first

vlclbf variable length code, left bit first, where "left" refers to the order in which the variable

length codes are written

bit(n) a bit string with n bits in the same format as bslbf

unsigned int(n) an unsigned integer with n bits in the same format as uimsbf

signed int(n) a signed integer with n bits, most significant bit first

mod modulo operator: $(x \mod y) = x - y \operatorname{floor}(x/y)$

size of x size operator that returns the bit size of a field x

TRUE/FALSE values of Boolean data type, which correspond to numerical 1 and 0, respectively

5 Technical overview

The technology described in this document is called the "DRC tool". It provides efficient control of dynamic range, loudness, and clipping based on metadata generated at the encoder. The decoder can choose to selectively apply the metadata to the audio signal to achieve a desired result. Metadata for dynamic range compression consists of encoded time-varying gain values that can be applied to the audio signal. Hence, the main blocks of the DRC tool include a DRC gain encoder, a DRC gain decoder, a DRC gain modification block, and a DRC gain application block. These blocks are exercised on a frame-by-frame basis during audio processing. In addition to encoded time-varying gain values, the DRC gain decoder can also receive parametric DRC metadata for generation of time-varying gain values at the decoder. Various DRC configurations can be conveyed in a separate bitstream element, such as configurations for a downmix or combined DRCs. The DRC set selection block decides based on the playback scenario and the applicable DRC configurations which DRC gains to apply to the audio signal. Moreover, the DRC tool supports loudness normalization based on loudness metadata.

A typical system for loudness and dynamic range control in the time domain is shown in Figure 1. A more complex system including downmixer and peak limiter is shown in Figure 2. The decoder part of the DRC tool is driven by metadata that efficiently represents the DRC gain samples and parameters for interpolation. The gain samples can be updated as fast as necessary to accurately represent gain changes down to at least 1 ms update intervals. In the following, the decoder part of the DRC tool is referred to as "DRC decoder", which includes everything except the audio decoder and associated bitstream de-multiplexing.

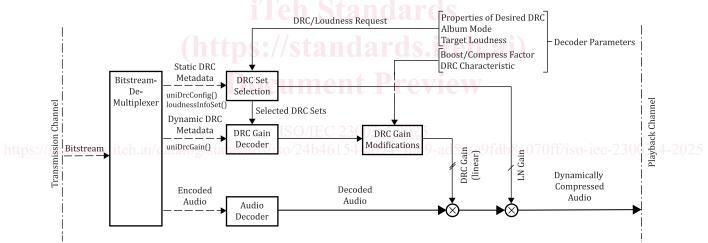

Figure 1 — Block diagram of a typical system with audio decoder and DRC tool modules to achieve loudness normalization (LN) and dynamic range control

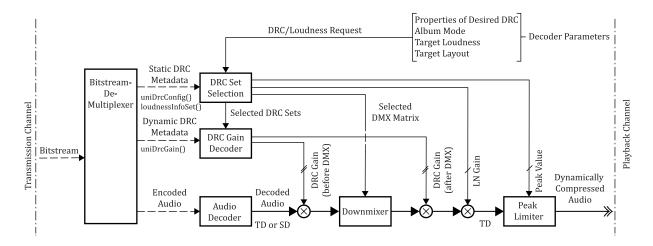

Figure 2 — Block diagram of a more complex system including downmixer and peak limiter (TD = time-domain, SD = subband-domain)

The DRC tool provides support for loudness equalization, sometimes called "loudness compensation", that can be applied to compensate for the effect of the playback level on the spectral balance. For this purpose, time-varying loudness information can be recovered from DRC gain sequences to dynamically control the compensation module. While the compensation module is out of scope, the interface describes in which frequency ranges the loudness information should be applied.

A flexible tool for generic metadata-controlled equalization is provided. The tool can be used to reach the desired spectral balance of the reproduced audio signal depending on a wide variety of playback scenarios, such as downmix, DRC, or playback room size. It can operate in the sub-band domain of an audio decoder and in the time domain.

The DRC tool is specified in <u>Clause 6</u>. The tool may be subject to profiles and levels that shall be in accordance with <u>Annex I</u>. The bitstream field decoding of the DRC tool shall be in accordance with <u>Annex A</u> (<u>Tables A.1</u> to <u>A.105</u>). If an interface for external parameter control of the DRC tool is used, it shall conform to <u>Annex B</u>.

ISO/IEC 23003-4:2025

6 DRC decoderai/catalog/standards/iso/24b46154-a094-4069-ad58-e9fdb8a070ff/iso-iec-23003-4-2025

6.1 DRC decoder configuration

6.1.1 Overview

The DRC configuration information can be received in-stream using the static payloads uniDrcConfig() and loudnessInfoSet() described below, or it can be delivered by a higher layer, such as in ISO/IEC 14496-12 (see Table 1). The basic decoding process of the static information is virtually the same. The difference consists mainly in a few syntax changes and reduced field sizes to increase the bit rate efficiency of the in-stream configuration. The syntax of the in-stream static payload is given in 7.3. The associated metadata encoding is given in A.6. The static DRC payload is evaluated once at the beginning of the decoding process and it is monitored subsequently. For static DRC payload changes during playback, see 6.12.

Table 1 — Overview of configuration (setup) and separate metadata track in ISO/IEC 14496-12

	Sample entry code	Setup (in sample entry)	Track reference	Sample format
Audio track	As specified for the audio codec in use (unchanged)	DRCInstructions box using negative values for <i>drcLo-cation</i>		As specified for the audio codec in use (unchanged)
Metadata track	"unid"	(none)	(none)	Each sample is a uni- DrcGain() payload

The static payload is divided into several logical blocks:

- channelLayout();
- downmixInstructions(), downmixInstructionsV1();
- drcCoefficientsBasic(), drcCoefficientsUniDrc(), drcCoefficientsUniDrcV1();
- drcInstructionsBasic(), drcInstructionUniDrc(), drcInstructionUniDrcV1();
- loudnessInfo(), loudnessInfoV1();
- drcCoefficientsParametricDrc();
- parametricDrcInstructions();
- loudEqInstructions();
- eqCoefficients();
- eqInstructions().

Except for the channelLayout(), drcCoefficientsParametricDrc(), and eqCoefficients(), multiple instances of a logical block can appear. The DRC decoder combines the information of the matching instances of the logical blocks for a given playback scenario. Matching instances are found by matching several identifiers (labels) contained in the blocks.

From the static payload, the decoder can also extract information about the effect of a particular DRC and various associated loudness information, if present. If multiple DRCs are available, this information can be used to select a particular DRC based on target criteria for dynamics and loudness (see <u>6.3</u>)

uniDrcConfig() contains all blocks except for the loudnessInfo() blocks which are bundled in loudnessInfoSet(). The last part of the uniDrcConfig() payload can include future extension payloads. In the event that a *uniDrcConfigExtType* value is received that is not equal to UNIDRCCONFEXT_TERM, the DRC tool parser shall read and discard the bits (*otherBit*) of the extension payload. Similarly, the last part of the loudnessInfoSet() payload can include future extension payloads. In the event that a *loudnessInfoSetExtType* value is received that is not equal to UNIDRCLOUDEXT_TERM, the DRC tool parser shall read and discard the bits (*otherBit*) of the extension payload. Each extension payload type in uniDrcConfig() or loudnessInfoSet() shall not appear more than once in the bitstream if not stated otherwise. An extension payload of type UNIDRCCONFEXT_V1 or UNIDRCCONFEXT_V2 shall preceed an extension payload of type UNIDRCCONFEXT_PARAM_DRC in the bitstream if both payloads are present. An extension payload of type UNIDRCCONFEXT_V1 shall precede an extension payload of type UNIDRCCONFEXT_LEVELING in the bitstream if both payloads are present. For ISO/IEC 14496-12, configuration extension payloads are provided according to Table 76.

The top level fields of uniDrcConfig() include the audio sample rate, which is a fundamental parameter for the decoding process (if not present, the audio sample rate is inherited from the employed audio codec). Moreover, the top level fields of uniDrcConfig() include the number of instances of each of the logical blocks, except for the channelLayout() block which appears only once. The top level fields of loudnessInfoSet() only include the number of loudnessInfo() blocks. The logical blocks are described in the following.

6.1.2 Description of logical blocks

6.1.2.1 channelLayout()

The channelLayout() block includes the channel count of the audio signal in the base layout. It may also include the base layout unless it is specified elsewhere. For use cases where the base audio signal represents objects or other audio content, the base channel count represents the total number of base content channels. The base channel count value shall serve as the value of baseChannelCount for parsing the downmixInstructions(), downmixInstructionsV1(), drcInstructionsUniDrc(), drcInstructionsUniDrcV1() and eqInstructions() payloads as specified in Clause 7.

6.1.2.2 downmixInstructions() and downmixInstructionsV1()

This block includes a unique non-zero downmix identifier (downmixId) that can be used externally to refer to this downmix. The targetChannelCount specifies the number of channels after downmixing to the target layout. It may also contain downmix coefficients, unless they are specified elsewhere. For use cases where the base audio signal represents objects or other audio content, the downmixId can be used to refer to a specific target channel configuration of a present rendering engine. In contrast to downmixInstructions(), the downmixInstructionsV1() payload includes an offset for all downmix coefficients and the coefficient decoding does not depend on the LFE channel assignment. The downmixInstructions() box for ISO/IEC 14496-12 contains the corresponding metadata of either one of the in-stream payloads as indicated by the version parameter of the box.

6.1.2.3 drcCoefficientsBasic(), drcCoefficientsUniDrc(), and drcCoefficientsUniDrcV1()

A drcCoefficients block describes all available DRC gain sequences in one location. The block can have the basic format or the uniDrc format. The basic format, drcCoefficientsBasic(), contains a subset of information included in drcCoefficientsUniDrc() that can be used to describe DRCs other than the ones specified in this document. drcCoefficientsUniDrc() contains for each sequence several indicators on how it is encoded, the time resolution, time alignment, the number of DRC sub-bands and corresponding crossover frequencies and DRC characteristics. The crossover frequencies shall increase with increasing band index. Alternatively, explicit indices in a decoder sub-band domain can be specified for the assignment of DRC sub-bands. The sub-band indices shall also increase with increasing band index. If the DRC gains are applied in the time-domain by using the multi-band DRC filter bank specified in 6.4.12, explicit index signalling is not allowed. The index of the DRC characteristic indicates which compression characteristic was used to produce the gain sequence. The DRC location describes where these gain sequences can be found in the bitstream. The DRC gain sequences in that location are inherently enumerated according to their order of appearance starting with 1.

The DRC location field encoding depends on the audio codec. A codec specification may include this specification, and use values 1 to 4 to refer to codec-specific locations as indicated in <u>Table 2</u>. For example, for AAC (ISO/IEC 14496-3), the codec-specific values of the DRC location field are encoded as shown in <u>Table 3</u>.

Table 2 — Encoding of *drcLocation* for in-stream payload

https://standa

drcLocation n	180/1EC 25005-4121Payload
0	Reserved
1	Location 1 (Codec-specific use)
2	Location 2 (Codec-specific use)
3	Location 3 (Codec-specific use)
4	Location 4 (Codec-specific use)
n > 4	reserved

Table 3 — Codec-specific encoding of drcLocation for MPEG-4 Audio

drcLocation n	Payload
1	uniDrc() (defined in <u>Clause 7</u>)
2	dyn_rng_sgn[i] / dyn_rng_ctl[i] in dynamic_range_info() (defined in ISO/IEC 14496-3:2019 subpart 4)
3	compression_value in MPEG4_ancillary_data() (defined in ISO/IEC 14496-3:2019)
4	reserved

The DRC frame size can optionally be specified. It shall be provided if the DRC frame size deviates from the default size specified in 6.4.2. If not specified, the default frame size is used.

The in-stream drcCoefficient syntax is given in <u>Table 65</u>, <u>Table 67</u> and <u>Table 68</u>. The syntax for the corresponding block for ISO/IEC 14496-12 (ISO base media file format) is shown in <u>Table 66</u> and <u>Table 69</u>.

The corresponding blocks carry essentially the same information. Values that are identically included in both blocks are coded the same way except for *drcLocation*.

The drcCoefficientsUniDrc() payload for ISO/IEC 14496-12 (see <u>Table 69</u>) for *version*=2 and *characteristicV1Override*=1 carries essentially the same information as the extension UNIDRCCONFEXT_V2. The corresponding bitstream fields are coded the same way as specified in <u>Table A.10</u>.

In ISO base media file format (see ISO/IEC 14496-12), for each codec that can be carried in MP4 files and that also carries DRC information, there is a specific definition of how the location is coded, using the $DRC_location$ field (see Table 4). A negative value of $DRC_location$ indicates that a DRC payload is in an associated meta-data track. That track is the n-th linked via a track reference of type "adrc" (audio DRC) from the audio track, where $n = abs(DRC_location)$, and the sample-entry type in the meta-data track indicates in which format the coefficients are stored. Table 3 defines the specific entries of the drcLocation field for AAC. Some example use cases are discussed in C.10.

If the uniDrc() payload is stored in a separate track in the ISO base media file format (ISO/IEC 14496-12), then the track is a metadata track with the sample entry identifier "unid" (uniDrc), with no required boxes added to the sample entry. The time synchronization with the linked audio track is the same as if the payload was in-stream.

drcLocation n	Payload	
<i>n</i> < 0	DRC payload located in n -th linked meta-data track	
0	reserved	
1	Location 1 (Codec-specific use)	
2	Location 2 (Codec-specific use)	
3 (http	Location 3 (Codec-specific use)	
4	Location 4 (Codec-specific use)

Table 4 — Encoding of drcLocation for ISO/IEC 14496-12

The drcCoefficientsUniDrcV1() payload is defined in <u>Table 68</u>. It contains the same information as drcCoefficientsUniDrc() except for the assignment of DRC gain sequences to gain sets and the optional specification of a number of parametric DRC characteristics. The drcCoefficientsUniDrc() payload assigns gain sequences in order of transmission. In contrast, the drcCoefficientsUniDrcV1() payload maps a gain sequence by index to *gainSets*. The latter permits to refer to the same gain sequence for multiple DRC bands which is not possible when using drcCoefficientsUniDrc(). If a drcCoefficientsUniDrcV1() payload is present, any drcCoefficientsUniDrc() payload for the same location is ignored.

The drcCoefficientsUniDrcV1() payload can also include information about dynamic equalization filters if the field *shapingFiltersPresent*==1. There can be a number of filters that are indexed in order of appearance. The DRC sets defined in drcInstructionsUniDrcV1() can refer to specific filters using their indices (see <u>6.4.11</u>).

6.1.2.4 drcInstructionsBasic(), drcInstructionsUniDrc(), and drcInstructionsUniDrcV1()

A drcInstructions block includes information about one specific DRC set that can be applied to achieve a desired effect. This block can have the basic format or the uniDrc format. The basic format, drcInstructionsBasic(), contains a subset of information included in drcInstructionsUniDrc() that can be used to describe DRCs other than the ones specified in this document. The information included in drcInstructionsUniDrc() consists mainly of pre-defined description elements such as the DRC set effect and the DRC gain sequences that are applied. The *drcSetEffect* field contains several effect bits as listed in <u>Table A.46</u>. Multiple bits can be set unless otherwise noted. If no effect bit is set at all, the DRC set is ignored in the DRC set selection (see <u>6.3</u>). Each drcInstructions block carries a unique non-zero identifier *drcSetId*. A *downmixId* is included to indicate if this DRC set applies to a certain downmix with this identifier. A *downmixId* of zero indicates that the DRC set is applied to the base layout. A *downmixId* of 0x7F indicates that the DRC set can be applied before or after the downmix. Since such a DRC can be applied to any downmix, it has only one channel group including all channels. If the bit for the "Duck other" or the "Duck/Level self" *drcSetEffect* is set, the DRC set is applied
