Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 45, *Rubber and rubber products*, Subcommittee SC 4, *Products (other than hoses)*.

This fourth edition cancels and replaces the third edition (ISO 22762-1:2018), of which it constitutes a minor revision.

The changes are as follows:

- the relation of this document to ISO 22762-5 and ISO 22762-6 have been added in Introduction;
- the normative references have been updated;
- the use of the terms "elastomeric isolators" and "seismic isolators have been made consistent:
- the term "fracture" has been replaced by "break" throughout the document.

A list of all parts in the ISO 22762 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

The ISO 22762 series includes two parts related to specifications for elastomeric isolators, i.e. ISO 22762-2 for bridges and ISO 22762-3 for buildings. This is because the elastomeric isolator requirements for bridges and for buildings are quite different, although the basic concept of the two products is similar. Therefore, ISO 22762-2 and the relevant clauses in this document are used when ISO 22762 (all parts) is applied to the design of bridge isolators, whereas ISO 22762-3 and the relevant clauses of this document are used when it is applied to building isolators.

The main differences to be noted between elastomeric isolators for bridges and elastomeric isolators for buildings are the following.

- a) Elastomeric isolators for bridges are mainly rectangular in shape and those for buildings are circular in shape.
- b) Elastomeric isolators for bridges are designed to be used for both rotation and horizontal displacement, while elastomeric isolators for buildings are designed for horizontal displacement only.
- c) Elastomeric isolators for bridges are designed to perform on a daily basis to accommodate length changes of bridges caused by temperature changes as well as during earthquakes, while elastomeric isolators for buildings are designed to perform only during earthquakes.
- d) Elastomeric isolators for bridges are designed to withstand dynamic loads caused by vehicles on a daily basis as well as earthquakes, while elastomeric isolators for buildings are mainly designed to withstand dynamic loads caused by earthquakes only.

For structures other than buildings and bridges (e.g. tanks), the structural engineer uses either ISO 22762-2 or ISO 22762-3, depending on the requirements of the structure.

ISO/TS 22762-4 is a guidance for the use of ISO 22762-3. ISO 22762-5 gives specifications and test methods for sliding seismic-protection isolators which are not specified as elastomeric isolators. ISO 22762-6 gives specifications and test methods for high-durability and high-performance elastomeric isolators. Three grades of requirements for each test item are introduced in ISO 22762-6.

ISO 22762-1:2024

Elastomeric seismic-protection isolators —

Part 1:

Test methods

1 Scope

This document specifies the test methods for determination of

- a) the properties of the rubber material used to manufacture the elastomeric isolators, and
- b) the characteristics of elastomeric isolators.

It is applicable to elastomeric isolators used to provide buildings or bridges with protection from earthquake damage. The elastomeric isolators covered consist of alternate elastomeric layers and reinforcing steel plates which are placed between a superstructure and its substructure to provide both flexibility for decoupling structural systems from ground motion, and damping capability to reduce displacement at the isolation interface and the transmission of energy from the ground into the structure at the isolation frequency.

2 Normative references Teh Standa

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

Terms and definitions 3

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at https://www.iso.org/obp/
- IEC Electropedia: available at https://www.electropedia.org/

3.1

breaking

rupture of *elastomeric isolator* (3.9) due to compression- (or tension-) shear loading

3.2

buckling

state when *elastomeric isolator* (3.9) lose their stability under compression-shear loading

3.3

compressive properties

 $K_{\rm v}$

compressive stiffness for all types of elastomeric isolator (3.9)

compression-shear testing machine

machine used to test *elastomeric isolator* (3.9), which has the capability of shear loading under constant compressive load

3.5

cover rubber

rubber wrapped around the outside of inner rubber and reinforcing steel plates before or after curing of *elastomeric isolator* (3.9) for the purposes of protecting the inner rubber from deterioration due to oxygen, ozone and other natural elements and protecting the reinforcing plates from corrosion

3.6

design compressive stress

long-term compressive force on the *elastomeric isolator* (3.9) imposed by the structure

3.7

effective loaded area

area sustaining vertical load in *elastomeric isolator* (3.9), which corresponds to the area of reinforcing steel plates

3.8

effective width

<rectangular elastomeric isolator> the smaller of the two side lengths of inner rubber to which direction shear displacement is not restricted

3.9

elastomeric isolator

rubber bearing, for seismic isolation of buildings, bridges and other structures, which consists of multilayered vulcanized rubber sheets and reinforcing steel plates

EXAMPLE High-damping rubber bearings, linear natural rubber bearings and lead rubber bearings.

3.10

first shape factor

ratio of effective loaded area to free deformation area of one inner rubber layer between steel plates

3.11

high-damping rubber bearing

HDR

elastomeric isolator (3.9) with relatively high damping properties obtained by special compounding of the rubber and the use of additives

3.12

inner rubber

rubber between multi-layered steel plates inside an *elastomeric isolator* (3.9)

3.13

lead rubber bearing

LRB

elastomeric isolator (3.9) whose *inner rubber* (3.12) with a lead plug or lead plugs press fitted into a hole or holes of the elastomeric isolator body to achieve damping properties

3.14

linear natural rubber bearing

LNR

elastomeric isolator (3.9) with linear shear force-deflection characteristics and relatively low damping properties, fabricated using natural rubber

Note 1 to entry: Any bearing with relatively low damping can be treated as an LNR bearing for the purposes of elastomeric isolator testing.

3.15

maximum compressive stress

peak stress acting briefly on elastomeric isolator (3.9) in compressive direction during an earthquake

3.16

nominal compressive stress

long-term stress acting on *elastomeric isolator* (3.9) in compressive direction as recommended by the manufacturer for the elastomeric isolator, including the safety margin 9a-d62d95cc7a08/iso-22762-1-2024

3.17

post-yield stiffness

shear stiffness of LRB after yielding of lead plug

3.18

roll-out

instability of an $\it elastomeric isolator (3.9)$ with either dowelled or recessed connection under shear displacement

3.19

routine test

test for quality control of the production *elastomeric isolator* (3.9) during and after manufacturing

3.20

second shape factor

<circular elastomeric isolator> ratio of the diameter of the inner rubber to the total thickness of the inner rubber

3.21

second shape factor

<rectangular or square elastomeric isolator> ratio of the effective width of the inner rubber to the total thickness of the inner rubber

3.22

shear properties

comprehensive term that covers characteristics determined from *elastomeric isolator* (3.9) tests:

- shear stiffness, K_h , for LNR;
- shear stiffness, K_h , and equivalent damping ratio, h_{eq} , for HDR and LRB;
- post-yield stiffness, K_d , and characteristic strength, Q_d , for LRB

3.23

structural engineer

engineer who is in charge of designing the structure for seismically isolated bridges or buildings and is responsible for specifying the requirements for *elastomeric isolator* (3.9)

3.24

ultimate properties

property at either buckling, breaking, or roll-out of an elastomeric isolator (3.9) under compression-shear loading

4 Symbols and cross-section of elastomeric isolator

4.1 Symbols

For the purposes of this document, the symbols given in <u>Table 1</u> apply.

Table 1 — Symbols and descriptions

Symbol	Description
A	effective plan area; plan area of elastomeric isolator, excluding cover rubber portion
$A_{\rm b}$	effective area of bolt
$A_{\rm e}$	overlap area between the top and bottom elastomer area of elastomeric isolator
$A_{\rm free}$	load-free area of elastomeric isolator
A _{load}	loaded area of elastomeric isolator ISO 22762-1:2024
http A /star	area of the lead plug for a lead rubber bearing $[4-4667-4c12-969a-d62d95cc7a08/iso-22762-1-2024]$
а	side length of square elastomeric isolator, excluding cover rubber thickness, or length in longitudinal direction of rectangular elastomeric isolator, excluding cover rubber thickness
$a_{\rm e}$	length of the shorter side of the rectangular elastomeric isolator, including cover rubber thickness
a'	length in longitudinal direction of the rectangular elastomeric isolator, including cover rubber thickness
В	effective width for bending of flange
b	length in transverse direction of the rectangular elastomeric isolator, excluding cover rubber thickness
b'	length in transverse direction of the rectangular elastomeric isolator, including cover rubber thickness
С	distance from centre of bolt hole to effective flange section
D'	outer diameter of circular elastomeric isolator, including cover rubber
D_{f}	diameter of flange
$d_{ m i}$	inner diameter of reinforcing steel plate
$d_{ m k}$	diameter of bolt hole
d_0	outer diameter of reinforcing steel plate
E_{ap}	apparent Young's modulus of bonded rubber layer
$E_{\rm c}$	apparent Young's modulus corrected, if necessary, by allowing for compressibility
$E_{\rm c}$ s	apparent Young's modulus corrected for bulk compressibility depending on its shape factor (S_1)
E_{∞}	bulk modulus of rubber
E_0	Young's modulus of rubber

Table 1 (continued)

Symbol	Description
$F_{\rm u}$	tensile force on elastomeric isolator by uplift
G	shear modulus
-	equivalent linear shear modulus as a function of shear strain
$G_{\text{eq}}(\gamma)$ H	height of elastomeric isolator, including mounting flange
	height of elastomeric isolator, excluding mounting flange
$H_{\rm n}$	equivalent damping ratio
$h_{\rm eq}$	equivalent damping ratio as a function of shear strain
$h_{\rm eq}(\gamma)$	post-yield stiffness (tangential stiffness after yielding of lead plug) of lead rubber bearing
$K_{\rm d}$	shear stiffness
K _h	initial shear stiffness
K _i	shear stiffness of lead plug inserted in lead rubber bearing
K _p	shear stiffness of lead rubber bearing before inserting lead plug
K _r	tangential shear stiffness
$K_{\rm t}$	compressive stiffness
K _V	length of one side of a rectangular flange
$L_{\rm f}$	resistance to rotation
M	
$M_{\rm f}$	moment acting on bolt
$M_{\rm r}$	moment acting on elastomeric isolator
n	number of rubber layers the Standards
$n_{\rm b}$	number of fixing bolts
P	compressive force 11108 / Standards Iteh. 21
P_0	design compressive force in absence of seismic action effects maximum compressive force including seismic action effects
P _{max}	minimum compressive force including seismic action effects minimum compressive force including seismic actions effects
P_{\min}	shear force ISO 22762-1:2024
Q http://stor	shear force at breaking tandards/iso/8d370ef4-4667-4ef2-969a-d62d95ec7a08/iso-22762-1-2024
http Q_b /star	shear force at buckling
$Q_{\rm buk}$	characteristic strength
$Q_{\rm d}$	first shape factor
S_1	second shape factor
$\frac{S_2}{T}$	Temperature
$T_{\rm L}$	minimum temperature
T_0	standard temperature, 23 °C or 27 °C
10	where specified tolerance is ±2 °C, it is standard laboratory temperature
$T_{\rm r}$	total rubber thickness, given by $T_r = n \times t_r$
$t_{\rm r}$	thickness of one rubber layer
$t_{\rm r1}, t_{\rm r2}$	thickness of rubber layer laminated on each side of plate
$t_{\rm s}$	thickness of one reinforcing steel plate
t_0	thickness of outside cover rubber
$U(\gamma)$	function giving ratio of characteristic strength to maximum shear force of a loop
v	loading velocity
$W_{\rm d}$	energy dissipated per cycle
X	shear displacement
X_0	design shear displacement
11 U	0

Table 1 (continued)

Symbol	Description
$X_{\rm b}$	shear displacement at break
$X_{\rm buk}$	shear displacement at buckling
$X_{\rm s}$	shear displacement due to quasi-static shear movement
X_{\max}	maximum shear displacement
$X_{\rm d}$	shear displacement due to dynamic shear movement
Y	compressive displacement
Z	section modulus of flange
α	coefficient of linear thermal expansion
γ	shear strain
γ_0	design shear strain
$\gamma_{\rm a}$	upper limit of the total of design strains on elastomeric isolators
$\gamma_{ m b}$	shear strain at breaking
$\gamma_{\rm c}$	local shear strain due to compressive force
$\gamma_{ m d}$	shear strain due to dynamic shear movement
$\gamma_{ m max}$	maximum design shear strain during earthquake
$\gamma_{\rm r}$	local shear strain due to rotation
$\gamma_{\rm s}$	shear strain due to quasi-static shear movement
γ_{u}	ultimate shear strain
$\delta_{ m H}$	horizontal offset of elastomeric isolator
$\delta_{ m v}$	difference in isolator height measured between two points at opposite extremes of the elastomeric isolator
3	compressive strain of rubber 812 110 2 170 S. 110 12 11
$\epsilon_{ m cr}$	creep strain
$\varepsilon_{ m T}$	tensile strain of elastomeric isolator
$arepsilon_{\mathrm{Tb}}$	tensile-breaking strain of elastomeric isolator
$arepsilon_{ ext{Ty}}$	tensile-yield strain of elastomeric isolator 2762-1:2024
httpsζ//stan	ratio of total height of rubber and steel layers to total rubber height d62d95cc7a08/iso-22762-1-2024
θ	rotation angle of elastomeric isolator about the diameter of a circular bearing or about an axis through a rectangular bearing
θ_{a}	rotation angle of elastomeric isolator in the longitudinal direction (a)
$ heta_{ m b}$	rotation angle of elastomeric isolator in the transverse direction (b)
λ	correction factor for calculation of stress in reinforcing steel plates
η	correction factor for calculation of critical stress
κ	correction factor for apparent Young's modulus according to hardness
Σγ	total local shear strain
σ	compressive stress in elastomeric isolator
σ_0	design compressive stress
$\sigma_{ m B}$	tensile stress in bolt
$\sigma_{ m b}$	bending stress in flange
$\sigma_{ m bf}$	allowable bending stress in steel
$\sigma_{ m cr}$	critical stress in elastomeric isolator
$\sigma_{ m f}$	allowable tensile stress in steel
$\sigma_{ m max}$	maximum design compressive stress
$\sigma_{ m min}$	minimum design compressive stress
$\sigma_{ m nom}$	for building: nominal compressive stress recommended by manufacturer

Table 1 (continued)

Symbol	Description
$\sigma_{_{ m S}}$	tensile stress in reinforcing steel plate
$\sigma_{ m sa}$	allowable tensile stress in steel plate
$\sigma_{ m sy}$	yield stress of steel for flanges and reinforcing steel plates
σ_{su}	tensile strength of steel for flanges and reinforcing steel plates
σ_{t}	tensile stress
$\sigma_{ m te}$	allowable tensile stress in elastomeric isolator
$ au_{ m B}$	shear stress in bolt
$ au_{ m f}$	allowable shear stress in steel
φ	factor for computation of buckling stability
ξ	factor for computation of critical stress

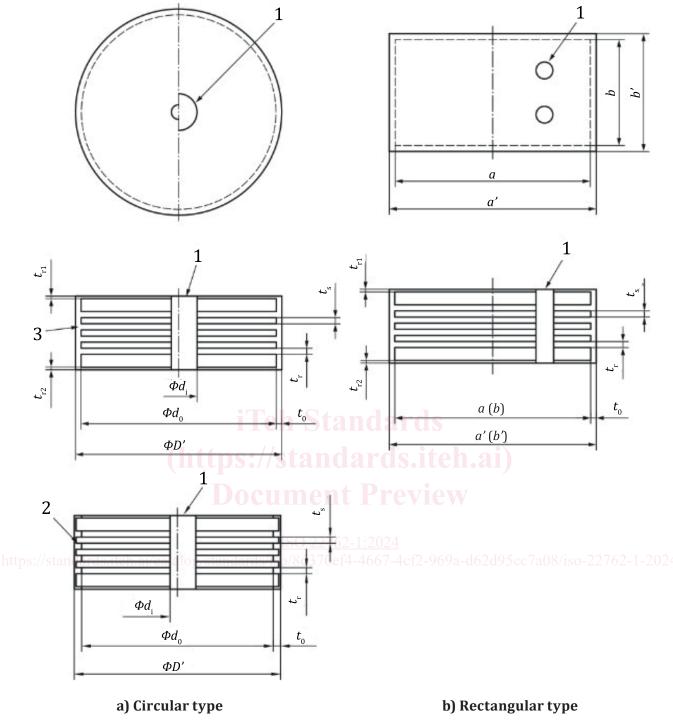

4.2 Cross-section of elastomeric isolator

A typical cross-section of the elastomeric isolator is given in $\underline{\text{Figure 1}}$.
