

## Designation: D6373 – 15

# Standard Specification for Performance Graded Asphalt Binder<sup>1</sup>

This standard is issued under the fixed designation D6373; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

## 1. Scope

1.1 This specification<sup>2</sup> covers asphalt binders graded by performance. Grading designations are related to the average seven-day maximum pavement design temperature, and minimum pavement design temperature. This specification contains **Table 1** and **Table 2**. **Table 2** incorporates Practice **D6816** for determining the critical low cracking temperature using a combination of Test Method **D6648** and Test Method **D6723** test procedures. If no table is specified, the default is **Table 1**.

NOTE 1—For asphalt cements graded by penetration at 25°C, see Specification **D946**. For asphalt cements graded by viscosity at 60°C see Specification **D3381**.

NOTE 2—AASHTO R 29 provides non-mandatory information for determining the performance grade of an asphalt binder.

1.2 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

### 2.1 ASTM Standards:<sup>3</sup>

- D8** Terminology Relating to Materials for Roads and Pavements
- D92** Test Method for Flash and Fire Points by Cleveland Open Cup Tester
- D95** Test Method for Water in Petroleum Products and Bituminous Materials by Distillation
- D140** Practice for Sampling Bituminous Materials
- D946** Specification for Penetration-Graded Asphalt Cement for Use in Pavement Construction
- D2042** Test Method for Solubility of Asphalt Materials in Trichloroethylene
- D2170** Test Method for Kinematic Viscosity of Asphalts (Bitumens)

**D2171** Test Method for Viscosity of Asphalts by Vacuum Capillary Viscometer

**D2872** Test Method for Effect of Heat and Air on a Moving Film of Asphalt (Rolling Thin-Film Oven Test)

**D3381** Specification for Viscosity-Graded Asphalt Cement for Use in Pavement Construction

**D4402** Test Method for Viscosity Determination of Asphalt at Elevated Temperatures Using a Rotational Viscometer

**D5546** Test Method for Solubility of Asphalt Binders in Toluene by Centrifuge

**D6521** Practice for Accelerated Aging of Asphalt Binder Using a Pressurized Aging Vessel (PAV)

**D6648** Test Method for Determining the Flexural Creep Stiffness of Asphalt Binder Using the Bending Beam Rheometer (BBR)

**D6723** Test Method for Determining the Fracture Properties of Asphalt Binder in Direct Tension (DT)

**D6816** Practice for Determining Low-Temperature Performance Grade (PG) of Asphalt Binders

**D7175** Test Method for Determining the Rheological Properties of Asphalt Binder Using a Dynamic Shear Rheometer

**D7553** Test Method for Solubility of Asphalt Materials in N-Propyl Bromide

### 2.2 AASHTO Standards:<sup>4</sup>

**AASHTO R 29** Grading or Verifying the Performance Grade of an Asphalt Binder

**AASHTO M 320** Standard Specification for Performance-Graded Asphalt Binder

## 3. Terminology

### 3.1 Definitions:

3.1.1 Definitions for many terms common to asphalt binder are found in Terminology Standard **D8**.

### 3.2 Definitions of Terms Specific to This Standard:

3.2.1 **asphalt binder**, *n*—an asphalt-based cement that is produced from petroleum residue either with or without the addition of modifiers.

<sup>1</sup> This specification is under the jurisdiction of ASTM Committee **D04** on Road and Paving Materials and is the direct responsibility of Subcommittee **D04.40** on Asphalt Specifications.

Current edition approved Jan. 1, 2015. Published January 2015. Originally approved in 1999. Last previous edition approved in 2013 as D6373 – 13. DOI: 10.1520/D6373-15.

<sup>2</sup> This specification is based on SHRP Product 1001 and AASHTO MP1.

<sup>A</sup>Pavement temperatures are estimated from air temperatures using an algorithm contained in the LTPP Bind software program, or are provided by the specifying agency.

<sup>B</sup>The referee method shall be **D4402** using a #21 spindle at 20RPM, however alternate methods may be used for routine testing and quality assurance. If the binder is too stiff to test with the No. 21 Spindle, the No. 27 spindle shall be used. The spindle size and shear rate shall be reported. This requirement may be waived at the discretion of the specifying agency if the supplier warrants that the asphalt binder can be adequately pumped and mixed at temperatures that meet all applicable safety standards.

<sup>C</sup>For quality control of unmodified asphalt cement production, measurement of the viscosity of the original asphalt cement may be substituted for dynamic shear measurements of G\*/sinθ at test temperatures where the asphalt is a Newtonian fluid. Any suitable standard means of viscosity measurement may be used, including capillary viscometry (Test Methods **D2170** or **D2171**) or rotational viscometry.

<sup>D</sup>The PAV aging temperature is based on simulated climatic conditions and is one of three temperatures 90°C, 100°C or 110°C. Normally the PAV aging temperature is 100°C for PG 58-xx and above. However, in desert climates, the PAV aging temperature for PG 70-xx and above may be specified as 110°C. If the creep stiffness is below 300 MPa, the direct tension test is not required. If the creep stiffness and m-value are unobtainable because the binder is too soft at the test temperature, the asphalt binder will be deemed to pass at that grade temperature if it meets the creep stiffness and m-value requirements at the test temperature minus 6°C.
