

Designation: B173 - 10 (Reapproved 2015)

Standard Specification for Rope-Lay-Stranded Copper Conductors Having Concentric-Stranded Members, for Electrical Conductors¹

This standard is issued under the fixed designation B173; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the U.S. Department of Defense.

1. Scope

- 1.1 This specification covers bare rope-lay-stranded conductors having concentric-stranded members made from round copper wires, either uncoated or coated with tin, lead, or lead-alloy for use as electrical conductors (Explanatory Note 1 and Note 2).
- 1.2 Coated wires shall include only those wires with finished diameters and densities substantially equal to the respective diameters and densities of uncoated wires.
- 1.3 The values stated in inch-pound or SI units are to be regarded separately as standard. Each system shall be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. For conductor sizes designated by AWG or kcmil, the requirements in SI units have been numerically converted from corresponding values, stated or derived, in inch-pound units. For conductor sizes designated by SI units only, the requirements are stated or derived in SI units.
 - 1.3.1 For density, resistivity, and temperature, the values stated in SI units are to be regarded as standard.

2. Referenced Documents

- 2.1 The following documents of the issue in effect at the time of reference form a part of this specification to the extent referenced herein:
 - 2.2 ASTM Standards:²
 - Document Preview **B3** Specification for Soft or Annealed Copper Wire
 - B8 Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
 - B33 Specification for Tin-Coated Soft or Annealed Copper Wire for Electrical Purposes
 - B172 Specification for Rope-Lay-Stranded Copper Conductors Having Bunch-Stranded Members, for Electrical Conductors
 - B189 Specification for Lead-Coated and Lead-Alloy-Coated Soft Copper Wire for Electrical Purposes
 - B193 Test Method for Resistivity of Electrical Conductor Materials
 - B263 Test Method for Determination of Cross-Sectional Area of Stranded Conductors
 - B354 Terminology Relating to Uninsulated Metallic Electrical Conductors
 - 2.3 American National Standard:
 - ANSI C42.35 Definitions of Electrical Terms³

3. Classification

- 3.1 For the purpose of this specification rope-lay-stranded conductors having concentric-stranded members are classified as follows:
- 3.1.1 Class G—Conductors consisting of 7 to 61 rope-lay-stranded members, each of which consists of 7 to 19 concentricstranded wires, with total conductor sizes ranging from No. 14 AWG (2.08 mm²) to 5 000 000 cmil (2534 mm²). (Typical use is for rubber-sheathed conductor, apparatus conductor, portable conductor, and similar applications.)

¹ This specification is under the jurisdiction of ASTM Committee B01 on Electrical Conductors and is the direct responsibility of Subcommittee B01.04 on Conductors of Copper and Copper Alloys.

Current edition approved April 1, 2010 April 1, 2015. Published May 2010 April 2015. Originally approved in 1942 to replace portions of B158 – 41 T. Last previous edition approved in $\frac{20072010}{20072010}$ as $\frac{B173-01a}{2007}$ and $\frac{10.1520}{2007}$ and $\frac{1$

Available from American National Standards Institute (ANSI), 25 W. 43rd St., 4th Floor, New York, NY 10036, http://www.ansi.org.

3.1.2 Class H—Conductors consisting of 19 to 91 rope-lay-stranded members, each of which consists of 7 to 19 concentric-stranded wires, with total conductor sizes ranging from No. 9 AWG (6.63 mm²) to 5 000 000 cmil (2534 mm²). Class K construction produces a conductor with greater flexibility than class G. (Typical use is for rubber-sheathed cord and applications where flexibility is required such as on take-up reels over sheaves and extra-flexible apparatus conductor.)

4. Ordering Information

- 4.1 Orders for material under this specification shall include the following information:
- 4.1.1 Quantity of each size and class;
- 4.1.2 Conductor size: circular-mil area or AWG (Section 7);
- 4.1.3 Class (Section 3 and Tables 1 and 2);
- 4.1.4 Whether coated or uncoated; if coated, designate type of coating (see 11.1);
- 4.1.5 Details of special-purpose lays, if required (see 6.2 and 6.3) and (Explanatory Note 3);
- 4.1.6 Package size (see 14.1);
- 4.1.7 Special package marking, if required (Section 15);
- 4.1.8 Lagging, if required (see 14.2); and
- 4.1.9 Place of inspection (Section 13).

5. Joints

- 5.1 Necessary joints in wires or in groups of wires shall be made in accordance with accepted eommerical practice, taking into account the size of the wire or group of wires as related to the size of the entire conductor.
 - 5.2 Concentric-stranded members forming the completed conductor may be joined as a unit by soldering, brazing, or welding.
- 5.3 Joints shall be so constructed and so disposed throughout the conductor that the diameter or configuration of the completed conductor is not substantially affected, and so that the flexibility of the completed conductor is not adversely affected.

6. Lay (Explanatory Note 3)

- 6.1 Conductors of the same size and description furnished on one order shall have the same lay.
- 6.2 The length of lay of the outer layer of the rope-lay stranded conductor shall be not less than 8 nor more than 16 times the outside diameter of the completed conductor. The length of lay of the other layers shall be at the option of the manufacturer unless specifically agreed upon. The direction of lay of the outer layer shall be left-hand, unless the direction of lay is specified otherwise by the purchaser. The direction of lay of the other layers shall be reversed in successive layers, unless otherwise agreed upon between the manufacturer and the purchaser.
- 6.3 The length of lay of the individual wires composing the stranded members shall be not less than 8 nor more than 16 times the outside diameter of that layer. Unless otherwise specified, the direction of lay of the outer layer of wires shall be at the option of the manufacturer. The direction of lay shall be reversed in successive layers, unless otherwise agreed upon between the manufacturer and the purchaser.

7. Construction

7.1 The area of cross section and the number and diameter of wires for a variety of strand constructions in general use are shown in Tables 1 and 2.

8. Physical and Electrical Tests

- 8.1 Tests for the electrical properties of wires composing conductors made from soft or annealed copper wire, bare or coated, shall be made before stranding.
- 8.2 Tests for the physical properties of soft or annealed copper wire, bare or coated, may be made upon the wires before stranding or upon wires removed from the completed stranded conductors, but need not be made upon both. Care shall be taken to avoid mechanical injury and stretching when removing wires from the conductor for the purpose of testing.
 - 8.3 The physical properties of wire when tested before stranding shall conform to the applicable requirements of 11.1.
- 8.4 The physical properties of wires removed from the completed stranded conductor shall be permitted to vary from the applicable requirements of 11.1 by the following amounts: (Explanatory Note 4):
- 8.4.1 Average of Results Obtained on All Wires Tested—The percent minimum elongation may be reduced by the value of 5 % from the values required for unstranded wires as specified by Specifications B3, B33, or B189, as applicable. For example, where the unstranded wire specification requires minimum elongation of 30 %, wire of that material removed from Specification B173 stranded conductor shall meet a minimum elongation value of 25 %, a value 5 % reduction.
- 8.4.2 Results Obtained on Individual Wires—The percent minimum elongation may be reduced by the value of 15 % from the values required for unstranded wires as specified by Specifications B3, B33, or B189, as applicable. For example, where the

A The constructions shown in this table are typical of those used in the industry. It is not intended that this table preclude other constructions that may be desirable for specific applications. The constructions shown provide for a finished, non-covered, stranded conductor approximately of the area indicated. When specified by the purchaser, the number or size of wires may be increased to provide additional area to compensate for draw-down during subsequent processing.

^B Values for the nominal diameter and mass of the completed conductor are approximate. The mass values are based upon the standard stranding increments listed in Explanatory Note 6Nete 6.
