

Designation: <del>D3276 - 07</del> D3276 - 15

# Standard Guide for Painting Inspectors (Metal Substrates)<sup>1</sup>

This standard is issued under the fixed designation D3276; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\varepsilon$ ) indicates an editorial change since the last revision or reapproval.

#### 1. Scope

1.1 This guide is intended as an information aid to painting inspectors in carrying out their task efficiently. It includes the key elements of surface preparation, coatings application, and final approval for both field and shop work. The items should be selected that are pertinent to the specification of a particular job.

Note 1—For additional helpful information, refer to the following documents:

Manual of Coating Work for Light-Water Nuclear Power Plant Primary Containment and Other Safety-Related Facilities<sup>2</sup>

New Concepts for Coating Protection of Steel Structures<sup>3</sup>

D16 Terminology for Paint, Related Coatings, Materials, and Applications <sup>4</sup>

D4538 Terminology Relating to Protective Coatings and Lining Work for Power Generation Facilities 4

SSPC-PA Guide 3 A Guide to Safety in Paint Application 5

Steel Structures Painting Manual Vol 1 Good Painting Practice 6

Steel Structures Painting Manual Vol 2 Systems and Specifications <sup>6</sup>

Manufacturers Specifications and Instructions (made available to the inspector for reference to special requirements for proper application)

Material-Safety Data Sheets (needed to ensure that personnel take necessary precautions in handling hazardous materials). Available from Materials manufacturer.

- 1.2 Certain industries or owners may require certified inspection personnel. See Guide D4537 for establishing procedures to certify inspectors for coatings work in nuclear facilities.
  - 1.3 The values stated in SI units are to be regarded as the standard. The values given in parentheses are for information only.
- 1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.
  - 1.5 This guide is arranged in the following order:

### 3. Significance and Use

3.1 This guide is intended as a reference for those concerned with the inspection of industrial coating work. Many of the details covered may be in a specification for a particular project. A specification for coating projects should include the coatings to be used. The requirements for inspection should be addressed in all protective coating and lining work specifications. This guide may be used by specification writers when selecting and establishing the inspection requirements for coating and lining specifications. A checklist for use by inspectors in the field is included asin Appendix X1an appendix. 6819(8350277/asim-d3276-15)

## 4. Preparation for Inspection

- 4.1 The guide describes the duties of the inspector and discusses inspection methods, both visual and instrumental, that can be used to determine that the specification requirements have been met by the painting contractor.
- 4.2 Before painting is started the project engineer should provide the inspector with information from the official plans and specifications as to coating type, thinner to be used, mixing ratios to be used, specified application thickness, primer, tie coat, topcoat, time between coats, surface preparation, method of application, and any special precautions to be followed such as limits on ambient conditions. These details should be recorded in an inspector's inspector's record book to eliminate any misunderstanding between the inspector and the contractor.
- 4.3 The inspector should obtain copies of Materials the Safety Data Sheets (SDS) for all products that will be used on the project, review any hazard communications program in accordance with 29 CFR 1926.59 that will apply to the project, and review other safety information related to the work that will be performed by the contractor. The inspector should examine these materials and be supplied with appropriate protective equipment and devices.
- 4.4 The Product Data Sheets (PDS) for the coating products to be used, including thinners where applicable, shall be provided with the procured product. Note that the coating specification may allow only specific pre-qualified coatings to be used.

#### 5. Surface Preparation Methods and Requirements

5.1 Surface Preparation is one of the most important factors affecting the performance of coatings. The specifier determines the proper level in accordance with the expected service life and type of coating specified.

Available from International Organization for Standardization (ISO), 1, ch. de la Voie-Creuse, CP 56, CH-1211 Geneva 20, Switzerland, http://www.iso.org.

Available from NACE International (NACE), 15835 Park Ten Pl., Houston, TX 77084, http://www.nace.org.

The pictorial surface preparation standard Method A (ISO/Swedish Standard) is available from ASTM International Headquarters. Request Adjunct No. ADJD2200.

- 5.1.1 *Pictorial Standard D2200 (SSPC-VIS 1)* should be provided to the inspector on a job involving blast cleaning of structural steel. The standard is used by the inspector to assist in determining whether the degree of surface preparation specified in a contract has been attained by the contractor. For large jobs it is recommended that before work starts, an actual steel sample of adequate size be blasted to the satisfaction of the project engineer. This blasted surface should be protected by a clear acrylic coating or encased in plastic and used for reference purposes as the work progresses.
- 5.2 Factors Affecting Coating Performance—There are a number of factors that should be considered to ensure a proper painting job.
- 5.2.1 Cleanliness—Many materials, if not removed from the surface, will affect the life of the coating. These include oil, grease, soil, weld spatter, and slag, that make it impossible to obtain proper adhesion to the metal surface. Deposits of salt (such as chlorides and sulfates) should be removed, or long-term coating performance will be seriously affected. SSPCSurface soluble salts shall be removed to the degree specified or long term coating performance may be adversely affected. SSPC/NACE issues detailed surface preparation specifications that cover methods for solvent cleaning, hand and power tool cleaning, as well as the various methods of blast various methods for cleaning.
- 5.2.2 *Mill Scale*, the The bluish-black oxide resulting from the hot-rolling process, is a constant source of trouble leading to coating failure. This scale is very brittle and can crack or loosen due to temperature changes (both in fabricating and weathering in the field) leading to failure of the coating.
- 5.2.3 Surface Profile—The texture of the metal surface has a significant effect on the performance of coatings, since it increases the surface area to which the coating can develop adhesion. In fact, the term "anchor pattern" is sometimes used to describe the depth of profile. Profile varies both with the type and size of the abrasive used. Coarser abrasives generally produce a coarser and deeper profile. Deep profiles are advantageous for adhesion, but require more coating to fill in the valleys and cover the peaks of the profile; they cannot be used with low-build coatings that do not cover the peaks even when several coats are applied. A general recommendation is that the surface profile should be one quarter to one third of the dry film thickness of the coating system. This recommendation does not apply if the resulting profile would be too great. The angularity (sharpness) and density of the profile may affect adhesion. Methods for measuring surface profile can be found in Test Methods D4417 and D7127. Frequency of surface profile measurement and the acceptability of the measurements is described in SSPC-PA 17.
- 5.2.4 Sharp Edges—Sharp edges and rough welds can compromise coating performance, particularly in immersion service. Sharp edges and outside corners should be radiused, and rough welds should be smoothed or ground flat. NACE SP0178 and SSPC-PA Guide 11 may be used as guides. This operation should be specified during fabrication, but is frequently done by the coating contractor. The coating inspector should verify that such work has been done, if required by the coating job specification prior to other steps in surface preparation.
- 5.3 Cleaning Procedures—Safety precautions are not addressed separately for each of the following cleaning methods. Each has its own safety-related hazards, and U.S. Occupational Health and Safety Administration regulations should be followed. Materials Safety Data Sheets (MSDS)(SDS) for the solvents and cleaning compounds provided by the manufacturer should also be consulted for proper worker protection.
- 5.3.1 Chemical Cleaning—Solvents are used to remove oil, grease, and related materials. The solvent is applied to the surface by wiping or scrubbing with rags or brushes. The contaminants should be removed (not simply spread out) by a thorough wiping of the affected areas with cloths saturated with clean solvent. Contaminated cloths should not be dipped into clean solvent. The cleaning should be repeated with clean rags and fresh clean solvent. Emulsions, cleaning compounds, steam cleaning, or similar methods and materials may also be used. Where emulsion cleaners, soaps, or detergents are used, they should be removed completely by washing with clean hot water. SSPC-SP 1 covers cleaning procedures using these materials.
- 5.3.1.1 Solvent Vapor Cleaning is a procedure that can be adapted to a production line or piecework operation. Vapor cleaning removes all soluble contaminants but does not disturb the natural oxide film. If this film should be removed, mechanical cleaning will be necessary as well. The part to be cleaned is placed in the saturated vapor above the heated solvent so that the solvent vapor condenses on the metal surface. Vapor degreasing does not remove particulate matter, so parts should be wiped to remove any insoluble soils. Vapor degreasing has the advantages over solvent wiping in that hot solvents are used and the solvent condensation removes oils without recontamination.
- 5.3.2 Hand Tool Cleaning is the method used for the removal of loose mill scale, loose rust, loose or otherwise defective coating, weld flux, slag and spatter from metal surfaces by hand brushing, hand sanding, hand chipping or scraping using wire, fiber or bristle brushes, sandpaper, steel wool, hand scrapers or chisels, and chipping hammers. Material is considered tightly adherent if it cannot be lifted with a dull putty knife. SSPC provides a detailed specification, SSPC-SP 2. A visual standard, SSPC-VIS 3, may be used to assist in determining compliance.
- 5.3.2.1 Hand tool cleaning requires that all weld flux, tar, oil and grease, and other greasy contaminants be removed first by solvent cleaning (5.3.1).
- 5.3.2.2 Wire brushes should be rigid enough to clean the surface thoroughly, and shaped to penetrate into all corners and joints. Brushes should be kept free of all materials that may clog the wires of the brush.
- 5.3.2.3 Hand scrapers should be made of tool steel, tempered and ground to a sharp edge, and should be of the proper size and shape to enable cleaning to be done as specified. Scrapers should be kept sharp at all times.

- 5.3.3 *Power Tool Cleaning* is a method used for the removal of loose mill scale, loose rust, loose or otherwise defective coating, and weld flux from metal surfaces by power wire brushes, power impact tools, power grinders, power sanders, or by a combination of these methods. Material is considered tightly adherent if it cannot be lifted with a dull putty knife. SSPC-SP 3 is the detailed specification for power tool cleaning. A visual standard, SSPC-VIS 3, may be used to assist in determining compliance.
- 5.3.3.1 *Power Tool Cleaning* Power tool cleaning requires that all oil, grease, weld flux, and other contaminants be removed first by solvent cleaning (5.3.1). Hand tool cleaning in accordance with 5.3.2 may be used prior to power tool cleaning.
- 5.3.3.2 All equipment should be suitable for the configuration of the work to be cleaned and maintained free of material that clogs the wire or disks making them ineffective. All impact tools should be kept sharp.
- 5.3.4 *Power Tool Cleaning to Bare Metal* is a method used for the total removal of coating, rust, and mill scale. It also requires a minimum of 1-mil anchor profile. Surface cleaning, power tools, and surface profile producing media are used to obtain the specified finish. Surface cleaning power tools consist of non-woven abrasive wheels and discs, coated abrasive discs or sanding pads, coated abrasive fly wheels, and coated abrasive bands. Surface profile producing media consist of rotary impact flap wheel assemblies and needle guns. SSPC-SP 11 is the detailed specification for power tool cleaning to bare metal.
- 5.3.4.1 Depending on the initial condition of the surface and existing profile conditions, it may be necessary to use one or both of the types of power tools. All oil, grease, weld flux, and other contaminants should be removed first by solvent cleaning (5.3.1). Hand tool cleaning (5.3.2) or power tool cleaning (5.3.3) may be used prior to power tool cleaning to bare metal.
- 5.3.4.2 All equipment should be suitable for the configuration of the work to be cleaned and maintained free of material that clogs the wire or discs making them ineffective. Needle-For example, needle guns require 2-mm diameter needles to produce a suitable surface profile.
- 5.3.4.3 The finished surface should be bare, bright metal. Slight residues of rust and paint may remain in the lower portions of pits if the original surface was pitted. SSPC-VIS 3 is a visual standard to assist in determining compliance. Surface profile is determined by procedures in 6.1.110.1.1.
- 5.3.4.4 Commercial Grade Power Tool Cleaning, SSPC-SP 15 is performed in a manner similar to SSPC-SP 11. The finished surface should be bare, bright metal. Staining is allowed on 33 percent of the evaluation unit area, and slight residues of rust and paint may remain in the lower portions of pits if the initial surface was pitted. It also requires a minimum of 1-mil anchor profile.
- 5.3.5 Blast Cleaning is used to remove coating, rust and mill scale from a metal surface and to provide a roughened surface by striking the surface with a stream of small, hard abrasive particles such as (dry) sand, grit, or shot.
- 5.3.5.1 One method utilizes compressed air, special blast nozzles, and abrasive. Water may be injected into the air stream to control dust, and a rust inhibitor may be needed. needed (5.3.6). In another method used primarily in fabricating shop, wheels propel the abrasive centrifugally against the work. The minimum and maximum particle size of the abrasive may be specified as a means of controlling the surface profile. The particle size can be verified by sieve test in accordance with Test Method D6914.
- 5.3.5.2 Blast cleaning requires that all oil, grease, and weld flux be removed by solvent cleaning (5.3.1). The compressed air used for blast cleaning should be free of condensed water or oil by making certain that separators and traps are in working order. Test the compressed air supply in accordance with Test Method D4285. The abrasive material should be free of soluble contaminants when tested in accordance with Test Methods D4940, D7393, or the appropriate SSPC abrasive specification (AB 1, AB 2, AB 3, or AB 4) for the type of abrasive material.
