

Designation: F2291 – 15

# Standard Practice for Design of Amusement Rides and Devices<sup>1</sup>

This standard is issued under the fixed designation F2291; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reappraisal. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reappraisal.

## 1. Scope

1.1 This practice establishes criteria for the design of amusement rides, devices and major modifications to amusement rides and devices manufactured after the effective date of publication except as noted in 1.2.

1.2 This practice shall not apply to:

1.2.1 Patron directed amusement rides or devices (for example, go karts, bumper cars, bumper boats),

1.2.2 Artificial climbing walls,

1.2.3 Air-supported structures,

1.2.4 dry slides,

1.2.5 coin operated rides,

1.2.6 Amusement rides or devices that involve the purposeful immersion of the patron's body partially or totally in the water and involves more than incidental patron water contact (for example, pools, water slides, lazy rivers, interactive aquatic play devices),

1.2.7 Amusement rides and devices whose design criteria are specifically addressed in another ASTM standard,

1.2.8 Portions of an amusement ride or device unaffected by a major modification,

1.2.9 Upgrades to electrical wiring, electrical motors and electrical components of amusement rides and devices provided the original design and safety criteria are maintained or enhanced, and

1.2.10 Pre-existing designs manufactured after the effective date of publication of this practice if the design is service proven or previously compliant and the manufacturer provides:

1.2.10.1 A historical summary of the amusement ride, device or major modification, and

1.2.10.2 A statement that the design is service proven or previously compliant as specified by Section 3.

1.2.10.3 Amusement rides and devices, and major modifications to amusement rides and devices may qualify as "previously compliant" for five years following the date of publication of this practice. Thereafter, amusement rides and devices, and major modifications to amusement rides and

devices must qualify as "service proven" or meet the requirements of this practice.

1.3 This practice includes an annex (mandatory), which provides additional information (for example, rationale, background, interpretations, drawings, commentary, and so forth) to improve the user's understanding and application of the criteria presented in this practice. The annex information shall be interpreted as mandatory design criteria.

1.4 This practice includes an appendix (non-mandatory), which provides additional information (for example, rationale, background, interpretations, drawings, commentary, and so forth.) to improve the user's understanding and application of the criteria presented in this practice. The appendix information shall not be interpreted as mandatory design criteria.

1.5 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

**3. Terminology**
**3.1 Definitions of Terms Specific to This Standard:**

**3.1.1 acceleration, impact**—those accelerations with duration of less than 200 ms.

**3.1.2 acceleration, sustained**—those accelerations with duration greater than or equal to 200 ms.

**3.1.3 automatic mode**—ability, after initialization, of the amusement ride or device to start, operate, move, etc. with limited or no operator intervention.

**3.1.4 control station**—a location where buttons, switches or other controls are provided for the purpose of operating ride equipment.

**3.1.5 designer/engineer**—party(s) that establishes and describes the configuration of the amusement ride or device, establishes strength and fatigue life, designs and develops electrical/electronic control systems, and defines inspection criteria.

**3.1.6 electrical (E)/electronic (E)/programmable electronic systems (PES) (E/E/PES)**—when used in this context, electrical refers to logic functions performed by electromechanical techniques, (for example, electromechanical relay, motor driven timers, and so forth), Electronic refers to logic functions performed by electronic techniques, (for example, solid state logic, solid state relay, and so forth), and Programmable Electronic System refers to logic performed by programmable or configurable devices (for example, Programmable Logic Controller (PLC)). Field devices are not included in E/E/PES.

**3.1.7 electro-sensitive protective equipment (ESPE)**—assembly of devices or components, or both, working together for protective tripping or presence-sensing purposes.

**3.1.8 fail-safe**—characteristic of an amusement ride or device, or component thereof, that is designed such that the normal and expected failure mode results in a safe condition.

**3.1.9 filter corner frequency (Fn)**—with reference to a low-pass filter, Fn is the frequency (specified in Hz) where the frequency response curve of the filter has magnitude of –3 dB.

3.1.10 *force limiting*—when pertaining to restraint devices, a characteristic that, regardless of the amount of force available from the system actuators, limits the amount of force applied to the patron(s).

3.1.11 *hand mode*—ability of the amusement ride or device to start, operate, move, etc. only with operator intervention.

3.1.12 *latching*—when pertaining to restraint devices, held secure against opening except by intentional action of the patron, operator, or other means. This can include restraints (for example, drop bars) held in place by gravity, detents or other means.

3.1.13 *locking*—when pertaining to restraint devices, held securely against opening except by intentional action of the operator or other means not accessible by the patron.

3.1.14 *manual release*—when pertaining to restraint devices, a hand or foot operated mechanism that allows for opening the patron restraint.

3.1.15 *manufacturer*—party producing the amusement ride or device, performing major modifications and can include the designer/engineer.

3.1.16 *operating mode*—a defined behavior of an amusement ride or device with a corresponding set of rules or interlocks that are implemented in control systems as required.

3.1.17 *patron clearance envelope*—patron reach envelope plus a margin of 3 in.

3.1.18 *patron containment*—features in an amusement ride or device that accommodate the patron for the purpose of riding the ride or device. This may include but is not limited to the seats, side walls, walls, or bulkheads ahead of the patron(s), floors, objects within the vicinity of the patron(s), restraint systems, and cages.

3.1.19 *patron reach envelope*—space a patron could reach during a ride cycle while properly positioned, as defined by the ride analysis, in the amusement ride or device and limited only by the vehicle, seat geometry, and restraint system.

3.1.20 *previously compliant*—amusement ride or device, or major modification to an amusement ride or device, of which the design meets the ASTM Standard in place at the time of its design.

3.1.21 *primary circulation area*—areas leading directly to the entrance and exit of a ride that are normally traveled by patrons. These areas would not include emergency exit routes, maintenance areas, or other areas not normally on the route of the patron.

3.1.22 *restraint*—system, device, or characteristic that is intended to inhibit or restrict the movement of the patron(s) while on the amusement ride or device.

3.1.23 *safety-related control system (SRCS)*—an assembly of components that monitor and control the amusement ride or device such that it: (1) mitigates hazards to persons; or (2) has the capability to block or otherwise alter the performance of systems that implement safety features. Components may include without limitation electronic, electric, electro-mechanical, hydraulic, pneumatic or mechanical devices, or combinations thereof.

3.1.24 *service proven*—an amusement ride, device, or major modification to an amusement ride or device of which (1) unit(s) have been in service to the public for a minimum of five years, and (2) unit(s) that have been in service have done so without any significant design related failures or significant design related safety issues that have not been mitigated.

3.1.25 *service proven practice*—a policy or procedure used in association with an amusement ride or device, which (1) has been in service to the public for a minimum of five years, and (2) has done so without any significant safety related issues that have not been mitigated.

3.1.26 *supervising companion*—a person on a ride or device who is qualified by a reasonable age or other means to understand rider instructions, assist a patron or child under 48 in. in height in complying with rider instructions, and who meets all other criteria for riding.

3.1.27 *use case*—a purpose for which equipment is used by persons or external systems. Examples of common use cases include but are not limited to entertaining patrons, supporting routine maintenance, and programming for creative intent. Use cases and operating modes may or may not have a one-to-one correspondence.

3.1.28 *zone of operator awareness*—area defined by the sights, sounds, and other stimuli an operator can reasonably be expected to monitor from their specified location(s) relative to the amusement ride or device that they are operating. The zone of operator awareness could include multiple, noncontiguous portions of a ride-vehicle path. Information provided by remote audio or video monitoring devices may be part of the zone of operator awareness.

## 4. Significance and Use

4.1 The purpose of this practice is to provide designers, engineers, manufacturers, owners, and operators with criteria and references for use in designing amusement rides and devices or a major modification for amusement rides or devices.

## 5. General Design Criteria

### 5.1 Ride Analysis:

5.1.1 The designer/engineer shall perform and document a ride analysis that illustrates how hazards to persons have been managed. The documentation shall include but not be limited to the following:

5.1.1.1 An identification of the scope of the analysis. The scope shall describe the equipment considered by the analysis. The scope shall identify the use cases of the amusement ride or device. The scope may be clarified by identifying excluded equipment or scenarios.

5.1.1.2 An identification of hazards that includes potential sources and consequences of harm.

5.1.1.3 An identification of hazardous scenarios.

(1) Hazardous scenarios shall consider physical areas where persons are expected to access.

(2) Hazardous scenarios shall consider exposure to hazards under all identified use cases.

(3) Hazardous scenarios related to maintenance personnel actions shall be restricted to routine, repetitive and essential procedures.

5.1.1.4 An assessment of hazards that includes a description of how identified hazards are mitigated to an acceptable level. Hazards are mitigated by reducing the severity of the hazard, reducing the probability of occurrence of related hazardous scenarios, or both. Hazards may or may not require mitigation. The assessment of hazards shall consider hazards that are created or aggravated by the means of mitigation and the potential for failure of the means of mitigation. This assessment shall include but not be limited to the following:

(1) *Patron Suitability Assessment*—A patron suitability assessment shall describe the suitability of the design of the amusement ride or device for the intended patrons, including anthropometric factors that relate age and physical size.

(2) *Patron Restraint and Containment Analysis*—A patron restraint and containment analysis shall be performed in accordance with Section 6.

(3) *Patron Clearance Envelope Analysis*—A patron clearance envelope analysis shall be performed in accordance with Section 6.

(4) *Failure Analysis*—A failure analysis shall be performed on the safety related systems of the amusement ride or device. The failure analysis shall include either a Fault Tree Analysis, a Failure Mode and Effects Analysis (FMEA), or other accepted engineering practices.

## 5.2 Hazard Mitigations:

5.2.1 Hazard mitigations shall consider the anticipated life-time of components, based on their expected use, as well as the means and methods for detecting component failures. Detection methods include but are not limited to automatic detection by a control system, periodic operational testing, and periodic inspection of components including non-destructive testing.

5.2.2 Hazard mitigations that involve safety-related control functions shall consider and identify:

5.2.2.1 System response/reaction time,

5.2.2.2 Tolerance limits for parameters (for example, speed, distance, force), and

5.2.2.3 Reliability, redundancy, and performance characteristics.

5.2.3 Hazard mitigations that involve operator responsibilities to perform actions shall:

5.2.3.1 Identify operator responsibilities and actions related to hazard mitigation and system responses to those actions.

5.2.3.2 Consider the specified operator responsibilities related to hazard mitigations in combination with other reasonably anticipated operator responsibilities.

5.2.4 Hazard mitigations that involve operator procedures, or involve routine, repetitive, and essential maintenance procedures shall:

5.2.4.1 Identify the frequency of the procedures, and

5.2.4.2 Define the elements that must be included in the documented procedures in order to make those procedures effective with respect to associated hazards.

5.2.5 The design shall identify appropriate devices that allow the operator(s) to enable, intercept, or affect amusement

ride or device operation considering the operator's specified responsibilities, specified location, and identified zone of operator awareness.

## 5.3 Design and Calculations:

5.3.1 The designer/engineer shall perform calculations showing compliance with the design criteria of this practice. Calculations and assessments of the following types are required.

5.3.1.1 Calculations verifying the adequacy of structural, mechanical, and electrical components.

5.3.1.2 Calculations of significant and predictable acceleration that is generated by the ride or device when operated as reflected in the manufacturer's provided operating and maintenance manuals or written instructions.

5.3.1.3 Performance and functional characteristics of control systems.

5.3.1.4 Calculations shall be performed using coordinate axis and load paths as defined by Practice F2137 or the EN equivalent.

5.4 *Other Design Considerations*—Where water is a design element of the ride or of related ride effects and is intended to contact the equipment of the ride, the designer/engineer should consider water quality maintenance and treatment when determining materials for use in manufacture.

## 5.5 Units:

5.5.1 Units of measurement shall be clearly specified in all documentation.

5.5.2 The coordinate system shown in Fig. 1 shall be used as the standard reference for acceleration directions, including the application of the different means of restraint in accordance with the criteria of the restraint diagram shown in Fig. 2.

## 5.6 Drawings and Records:

5.6.1 The designer/engineer or manufacturer shall produce and retain as-built drawings, calculations, and control software that depict the amusement ride, device, or major modification details. These drawings and calculations shall be retained for a minimum of 20 years from the date of last manufacture. In the case of a major modification, only the records associated with that major modification, and not the entire ride or device, must be retained for a minimum of 20 years.

5.6.2 Documents deemed proprietary and confidential by the manufacturer shall include a statement of such on each document. Use of the manufacturer's documentation and records should be limited, where possible, to the installation, maintenance, inspection, and operation of the ride or device. All other dissemination should be limited.

5.6.3 Documentation supplied to the buyer, owner, or operator shall be complete and adequate for proper installation, maintenance, inspection, and operation of the amusement ride, device, or major modification.

5.6.4 Drawings and documents shall illustrate and define all important dimensions and tolerances. Dimensions, tolerances, and other important characteristics shall be clearly depicted in appropriate views and cross sections. The following shall be included:

FIG. 1 Patron Coordinate System

5.6.4.1 General drawings or diagrams in plan, elevation, and section views showing the general arrangement of components, including patron clearance envelope as described in Section 6 of this practice.

5.6.4.2 Assembly and subassembly drawings providing additional views of areas not clearly discernible from the general drawings and providing clear identification and specification of all included components, their locations, and other information as applicable, for example, proper adjustment(s), fastener tightening specifications, descriptions of any other materials or lubricants used, and other important information.

5.6.4.3 Detailed drawings of all components specifically manufactured for use in the amusement ride, device, or major modification.

5.7 Regulatory Body Review Documents:

5.7.1 When the approval of the amusement ride, device, or major modification design is required by a regulatory authority, the following documents are typically made available for review:

5.7.1.1 General assembly drawings,

5.7.1.2 Facility interface drawings and related load calculations,

5.7.1.3 Operations, maintenance, and assembly instructions, and

5.7.1.4 Information otherwise called for in accordance with the guidelines in Practice F1193.

5.7.2 Use of the manufacturer's documentation and records should be limited to the regulatory approval process and dissemination shall be limited to minimize disclosure of proprietary and confidential documents.

NOTE 1—

1. For cases on a boundary, the lower category may be chosen.
2. Accelerations are limited to the sustained values in Section 7.
3. This diagram is intended for use with restraint systems where the patron begins the ride in the sitting or standing position (that is, spine nearly aligned with gravity).

FIG. 2 Restraint Determination Diagram—Accelerations in Design Stage

## 6. Patron Restraint, Clearance Envelope, and Containment Design Criteria

### 6.1 Patron Containment:

6.1.1 The amusement ride or device shall be designed to support and contain the patron(s) during operation. This support and containment, that is, the patron containment, shall be consistent with the intended action of the ride or device.

6.1.2 Parts of amusement rides and devices that patrons may reasonably be expected to contact shall be smooth; free from unprotected protruding studs, bolts, screws, sharp edges and corners, and rough or splintered surfaces; and considered for padding as appropriate.

### 6.1.3 Ride or Device Vehicle Doors:

6.1.3.1 When amusement ride or device patron vehicles are provided with doors, measures shall be taken to ensure that the doors do not open during operation, failure, or in case of emergency, unless otherwise determined by the ride analysis.

6.1.3.2 Powered doors shall be designed to minimize pinch points and entrapment areas. The doors' (opening and closing) movement shall be controlled, and the maximum exerted force, measured on the edge of the door at the furthest point from the hinge or pivot, shall not exceed 30 lb (133 N).

### 6.2 Security of Patron Containment System:

6.2.1 Any system or systems used to support and contain the patron(s) shall be securely fixed to the structure of the ride or device and shall have adequate strength for the intended forces produced by the ride or device and the reasonably foreseeable actions of the patron(s).

### 6.3 Patron Restraints:

6.3.1 Patron restraints shall be provided as determined by the designer/engineer. This determination shall be based on the patron restraint and containment analysis performed in accordance with criteria defined in this practice and shall take into consideration the nature of the amusement ride or device and the intended adult or child patron physical characteristics, based on anthropomorphic data such as Dreyfuss Human Scale 4/5/6 (1)<sup>29</sup>, 7/8/9 (2), or SAE J833, and Center for Disease Control Growth Charts. When evaluating anthropometric data to be used in design, the designer/engineer shall consider that the patron height requirement will be enforced as stated in Practice F770, subsection 4.2.2.

6.3.2 The patron restraint and containment analysis may identify the need for a restraint system for reasons other than acceleration or seat inclination. The analysis shall also evaluate the need for locking or latching functions when restraints are required.

6.3.3 The manufacturer shall take into consideration the evacuation of patrons from any reasonably foreseeable position or situation on the ride or device, including emergency stops and stops in unplanned locations. The patron restraint and containment analysis shall address whether individual or group restraints releases are appropriate.

<sup>29</sup> The boldface numbers in parentheses refer to the list of references at the end of this standard.

6.3.4 The manufacturer shall specify the state, locked or unlocked, of the restraint system in the event of unintended stop, for example, emergency stop or loss of power. This specification shall be based on the results of the ride analysis performed in 5.1.

6.3.5 Restraints shall be designed such that the opportunity for pinching or unintentional trapping of fingers, hands, feet, and other parts of the patron's body is minimized.

6.3.6 The maximum exerted force produced by any powered patron restraint device while opening or closing shall not be more than 18 lb (0.08 kN), measured on the active surfaces contacting the patron. Force limiting systems, if used to achieve this, shall be configured so that the failure of any one element of that system will still result in force being limited to 18 lb (0.08 kN).

6.3.7 The manufacturer shall take into account the patron-induced loads, for example, bracing, etc., in addition to the loads and criteria specified in the Loads and Strengths section of this practice.

6.3.8 A manual restraint release shall be provided for authorized personnel use.

6.3.8.1 The manual release should be conveniently located and easily accessed by authorized personnel without crawling over or under or otherwise coming in direct contact with the patrons.

6.3.8.2 External or unmonitored internal nonmechanical stored energy, for example, battery, accumulator, hydraulic, or pneumatic, shall not be used for a manual release unless otherwise determined by the ride analysis.

6.3.8.3 Special tools shall not be required to operate the manual release, unless otherwise determined by the ride analysis.

6.3.9 When a latching or locking restraint device is provided, the Patron Restraint and Containment Analysis shall evaluate the need for features such as contours, dividers, bolsters or other forms and shapes that aid in preventing patrons from sliding longitudinally or laterally outside of the restraint area.

#### 6.4 *Restraint Configuration:*

##### 6.4.1 *Restraints Required in Kiddie Rides:*

6.4.1.1 Where kiddie rides or devices do not provide a fully enclosed compartment (that is, so as to reject a 4 in. diameter sphere at all openings), a latching restraint shall be provided, unless the patron restraint and containment analysis indicate a locking restraint is needed or a restraint is not appropriate (for example, a kiddie canoe ride).

6.4.1.2 Where kiddie rides or devices provide either latching or locking restraints, the final latching or locking position of the restraint must be adjustable in relation to the patron(s).

6.4.1.3 When a latching restraint is used and a supervising companion is not required, the latching device must be difficult for a child Patron to open by virtue of its design or location, for example, beyond the child Patrons reach envelope or a "push to open" buckle with a release force of 9 lbf (40 N) or greater. A recognized test such as found in FMVSS No. 213 (October 1, 2004 edition, paragraph S6.2.1) may be used to determine release force.

6.4.2 *Restraints Required in or Supervision Required for Rides That Accommodate Both Children Under 48 in. in Height and Adults:*

6.4.2.1 Amusement rides or devices intended to accommodate both children under 48 in. in height and adults shall meet the requirements of 6.4.1 or employ other safeguards such as a supervising companion or other means determined by the ride analysis.

6.4.2.2 When a supervising companion is employed to accompany children under 48 in. in height on rides that accommodate both children under 48 in. in height and adults, the supervising companion must either:

- (1) Comply with a service proven practice of the operating facility which relates to qualifying supervising companions, or
- (2) Meet all the criteria for riding alone and be approximately 14 years of age or older. (See X6.2). A ride analysis may lead to alternate requirements.

6.4.3 *Restraints Required Due to Acceleration and Seat Inclination:*

6.4.3.1 Restraint devices shall be provided in cases where it is reasonably foreseeable that patrons could be lifted or ejected from their seats or riding positions by the acceleration of the amusement ride or device, or by seat inclination, during the ride or device cycle and other reasonably foreseeable situations, for example, the application of emergency brakes or vehicles stopped in inverted positions.

6.4.3.2 The restraint diagram shown in Fig. 2 shall be used as part the patron restraint and containment analysis for determining if a restraint is required, and if required, what type. The restraint diagram identifies and graphically illustrates five distinctive areas of theoretical acceleration. Each of the five distinctive areas may require a different class of restraint as indicated in 6.5 of this practice. The restraint diagram applies for "sustained acceleration" levels only. It is not to be applied for "impact acceleration."

6.4.3.3 *Restraint Criteria*—Referring to areas on the restraint determination diagram shown in Fig. 2, as a minimum, the following restraint classes shall be used (in all areas, a higher class restraint device or individual requirements of a higher class restraint device may be used).

6.4.3.4 *Area-1*—A Class-1 restraint device is defined as unrestrained or no restraint at all.

(1) Based solely on Area-1 dynamic forces, no restraint is required; however, other criteria in this practice (that is, the ride analysis) may require a higher class restraint device.

6.4.3.5 *Area-2*—A Class-2 restraint is required unless patrons are provided sufficient support and the means to react to the forces, for example, handrails, footrest, or other devices. A Class-2 restraint is generally defined as a latching restraint device for each individual patron or a latching collective restraint device for more than one patron. A Class-2 restraint device shall have at least the following:

(1) *Number of Patrons Per Restraint Device*—The restraint device may be for an individual patron or it may be a collective device for more than one patron.

(2) *Final Latching Position Relative to the Patron*—The final latching position may be fixed or variable in relation to the patron.

(3) *Type of Latching*—The patron or operator may latch the restraint.

(4) *Type of Unlatching*—The patron or operator may unlatch the restraint.

(5) *Type of External Correct or Incorrect Indication*—No external indication is required.

(6) *Means of Activation*—The restraint may be manually or automatically (for example, motorized) opened and closed.

(7) *Redundancy of Latching Device*—Redundancy is not required.

6.4.3.6 *Area-3*—A Class-3 restraint is required. A Class-3 restraint is generally defined as a latching restraint device for each individual patron or a latching collective restraint device for more than one patron. A Class-3 restraint device shall have at least the following:

(1) *Number of Patrons per Restraint Device*—The restraint device may be for an individual patron or it may be a collective device for more than one patron.

(2) *Final Latching Position Relative to the Patron(s)*—The final latching position must be variable in relation to the patron(s), for example, a bar or a rail with multiple latching positions.

(3) *Type of Latching*—The patron or operator may manually latch the restraint or it may be automatically latched. The manufacturer shall provide instructions that the operator shall verify the restraint device is latched.

(4) *Type of Unlatching*—The patron may manually unlatch the restraint or the operator may manually or automatically unlatch the restraint.

(5) *Type of External Correct or Incorrect Indication*—No external indication is required. The design shall allow the operator to perform a visual or manual check of the restraint each ride cycle.

(6) *Means of Activation*—The restraint may be manually or automatically (for example, motorized) opened and closed.

(7) *Redundancy of Latching Device*—Redundancy is not required.

6.4.3.7 *Area-4*—A Class-4 restraint is required. A Class-4 restraint is generally defined as a locking restraint device for each individual patron. A Class-4 restraint device shall have at least the following:

(1) *Number of Patrons per Restraint Device*—A restraint device shall be provided for each individual patron.

(2) *Final Latching Position Relative to the Patron*—The final latching position of the restraint must be variable in relation to the patrons, for example, a bar or a rail with multiple latching positions.

(3) *Type of Locking*—The restraint device shall be automatically locked.

(4) *Type of Unlocking*—Only the operator shall manually or automatically unlock the restraint.

(5) *Type of External Correct or Incorrect Indication*—No external indication is required. The design shall allow the operator to perform a visual or manual check of the restraint each ride cycle.

(6) *Means of Activation*—The restraint may be manually or automatically (for example, motorized) opened or closed.

(7) *Redundancy of Locking Device*—Redundancy shall be provided for the locking device function.

6.4.3.8 *Area-5*—A Class-5 restraint is required. A Class-5 restraint shall have at least the following:

(1) *Number of Patrons per Restraint Device*—A restraint device shall be provided for each individual patron.

(2) *Final Latching Position Relative to the Patron*—The final latching position of the restraint must be variable in relation to the patrons, for example, a bar or a rail with multiple latching positions.

(3) *Type of Locking*—The restraint device shall be automatically locked.

(4) *Type of Unlocking*—Only the operator shall manually or automatically unlock the restraint.

(5) *Type of External Correct or Incorrect Indication*—An external indication is required. Detecting the failure of any monitored device shall either bring the ride to a cycle stop or inhibit cycle start.

(6) *Means of Activation*—The restraint may be manually or automatically (for example, motorized) opened or closed.

(7) *Redundancy of Locking Device*—Redundancy shall be provided for the locking device function.

(8) *Restraint Configuration*—Two restraints, for example, shoulder and lap bar or one fail-safe restraint device is required.

6.4.3.9 *Secondary Restraints for Class 5*—A Class-5 restraint configuration may be achieved by the use of two independent restraints or one fail-safe restraint. When two independent restraints are used, the secondary restraint device may be an individual locking restraint device or a collective locking restraint device. The secondary restraint shall have the following minimum characteristics:

(1) *Number of Patrons per Restraint Device*—The restraint device may be for an individual patron or it may be a collective device for more than one patron.

(2) *Final Latching Position Relative to the Patron*—The final latching position may be fixed or variable in relation to the patron.

(3) *Type of Locking*—Only the operator may manually or automatically lock the restraint.

(4) *Type of Unlocking*—Only the operator shall manually or automatically unlock the restraint.

(5) *Type of External Correct or Incorrect Indication*—No external indication is required other than a visual check of the restraint itself.

(6) *Means of Activation*—The restraint may be manually or automatically (for example, motorized) opened or closed.

(7) *Redundancy of Locking Device*—Redundancy is not required. The locking and unlocking of the secondary restraint shall be independent of the primary restraint.

#### 6.4.4 *Other Restraint Considerations:*

6.4.4.1 The application of the restraint diagram is intended as a design guide. The ride analysis or other factors or requirements of this practice may indicate the need to consider another class of restraint (either higher or lower). Any special situation needs to be taken into consideration in designing the restraint system. These may include:

(1) Duration and magnitude of the acceleration,

- (2) Height of the patron-carrying device above grade or other objects,
- (3) Wind effects,
- (4) Unexpected stopping positions of the patron units, for example, upside down,
- (5) Lateral accelerations, for example, where sustained lateral accelerations are equal to or greater than 0.5 G, special consideration shall be given to the design of seats, backrest, headrest, padding, and restraints, and
- (6) The intended nature of the amusement ride or device.

6.4.4.2 When the ride analysis indicates that there is a significant risk in restraining guests, for example, in log flume ride vehicles that may swamp or overturn, and the methods of patron containment specified in the restraint diagram for fore/aft accelerations would create a hazard, it is acceptable to use other methods or a combination of other methods such as patron separation devices, padding, handrails or footrests as determined by the ride analysis.

6.5 The physical information provided in accordance with Practice **F1193** shall be consistent with the patron restraint system, if any.

#### 6.6 Patron Clearance Envelope Analysis:

6.6.1 Amusement rides and devices shall be designed to provide a patron clearance envelope adequate to minimize the opportunity for contact between the patron and other objects where said contact is likely to cause injury.

6.6.2 Where surrounding surfaces or objects are allowed within the patron clearance envelope of an amusement ride or device, reasonably appropriate measures shall be taken to ensure that those surfaces or objects are configured to avoid hostile features such as splinters, sharp or sharply angled features or edges, protruding items, pinch points, or entrapment areas. This requirement is especially important in a ride or device load/unload area where patron control and assistance devices are provided. The ride analysis shall specifically address these issues.

6.6.2.1 When the design of an amusement ride and device allows patron-to-patron contact (for example, while seated in separate vehicles), the designer/engineer shall take reasonably appropriate steps to ensure that the potential contact is appropriate for the amusement ride or device's intended use and the intended patron experience.

6.6.3 The designer/engineer shall determine the shape and size of the required patron clearance envelope based on the appropriate patron model, the patron reach envelope, and the design of the patron containment system, if any. The minimum patron model shall be based on Dreyfuss Human Scale 4/5/6 **(1)**, 7/8/9 **(2)**, SAE J833, or CDC 95th percentile, with an additional (extended) arm and leg reach of 3 in. (effectively a 99.9th percentile) male, adult or child, as appropriate (see Section **2**). The following shall be considered:

- 6.6.3.1 The intended patron size and height and any designer/engineer specified restriction for minimum or maximum patron height.
- 6.6.3.2 The shape(s) and configuration of the patron containment system, including:
  - (1) Seats, armrest, seat back and sides, foot well, or other,

- (2) Associated restraint system(s), if provided, for example, lap bar, seat belt, shoulder restraint, cage, or other, and

- (3) The ability, as limited by the patron containment, of the patron to extend any part of his or her body, for example, arms and legs, through vehicle openings or outward beyond the perimeters of the vehicle.

6.6.3.3 The physical nature of surrounding objects or surfaces that might otherwise be contacted, for example, sharp, hard, rough or abrasive, ability to snag or trap and hold, or other attributes that may produce undesirable contact for the patrons of the ride or device.

6.6.3.4 The relative speeds and directions that contact might take place.

6.6.3.5 The reasonably foreseeable changes that are likely to occur in the location or nature of the surroundings, for example, other adjacent moving vehicles or objects and their physical nature and speeds.

6.6.3.6 The possibility of variations in the position or orientation of the patron carrying device, (for example, angular movement, side movement, unrestrained or undamped motion, or free swinging).

6.6.4 The designer/engineer or manufacturer shall determine a means by which direct measurement may be taken to confirm that the intended patron clearance envelope is attained in the completed amusement ride or device assembled in its operating location.

6.6.4.1 The determined means for direct measurements shall include points from which measurements may be taken. The locations of these points shall be illustrated with appropriate drawings in the manufacturer provided instructions or they may be physical markers on the amusement ride or device.

6.6.4.2 The determined means for direct measurements and the patron clearance envelope shall be shown in a convenient form and illustrated both graphically and numerically. Illustrations similar to **Figs. 3-5** are one acceptable method.

6.6.5 Any moveable system or device designed to temporarily encroach on the patron clearance envelope, that is, loading/unloading platforms, decks, or other devices, shall be designed in a fail-safe manner in order to prevent unintended contact.

6.7 *Signage*—The manufacturer shall determine and may make recommendations for appropriate advisory signs or warning signs based on the attributes of the amusement ride or device. These recommendations should be clear and concise, but are not intended to be the final wording of the signs that may be generated and displayed at the ride or device.

## 7. Acceleration Limits

### 7.1 Acceleration Limits:

7.1.1 Amusement rides and devices shall be designed such that the ride dynamics, when measured as provided herein, are within the limits specified in this practice. The design acceleration levels of the final operational assembly of a newly developed amusement ride, device, or major modification shall be verified at commissioning by testing. Test data intended for evaluation against the limits specified in this practice shall be acquired and prepared as follows:

FIG. 3 Sample Patron Clearance Envelope Illustration Front View Configuration

FIG. 4 Sample Patron Clearance Envelope Illustration Front View Configuration

7.1.1.1 The data shall be acquired in accordance with the provisions of the Standard Amusement Ride Characterization (SARC) test, as specified in Section 12 of Practice F2137. For testing performed subsequent to commissioning testing and when determined to be acceptable by the designer, engineer or a biodynamic expert, it is permissible to vary the testing ballast weight from that specified in the Practice F2137 SARC test. The testing ballast weight variation shall be documented in the test data record.

7.1.1.2 The acquired test data shall be post-processed, with a 4-pole, single pass, Butterworth low pass filter using a corner frequency ( $F_n$ ) of 5 Hz.

7.1.1.3 The post-processed test data may be evaluated against the acceleration limits herein by using either manual

(for example, graphic, hand calculations, etc.) or automatic (for example, computational, computer, etc.) procedures.

7.1.2 Amusement rides and devices or major modifications that are designed to operate outside the acceleration limits herein shall include justification in the ride analysis. The justification shall include a review by a biodynamic expert.

7.1.3 Acceleration can vary greatly depending on the type and design of the amusement ride or device, and the effect of these accelerations is dependent on many factors that may be considered in the design (see Appendix X2). Accelerations shall be coordinated with the intended physical orientation of the patron during the operating cycle. Rides and devices with patron containment systems shall be designed such that the patron is suitably contained and positioned to accept these

FIG. 5 Sample Patron Clearance Envelope Illustration Side View Configuration

accelerations. The patron restraint and containment analysis shall consider cases related to patron position within the restraint as determined by the designer/engineer. Fig. 1 illustrates the coordinate system utilized.

7.1.4 Sustained acceleration limits are shown in this section (see Figs. 6-10). The following definitions apply:

7.1.4.1 Acceleration units are “G” (32.2 ft/s/s or 9.81 m/s/s).

7.1.4.2 The sustained acceleration limits of this section (Figs. 6-10) do not address impacts of less than 200 ms duration.

7.1.4.3 Acceleration limits herein are for patrons 48 in. in height and above. The designer/engineer shall determine whether these or more restrictive limits are appropriate for an amusement ride or device that accommodates patrons under 48 in. in height. In making this determination, the designer/engineer shall consider biodynamic effects on the patrons. If an amusement ride, device, or major modification that accommodates patrons under 48 in. in height is designed to operate outside the acceleration limits herein, the ride analysis must include a review by a biodynamic expert.

7.1.4.4 Because of insufficient data, acceleration limits herein do not address patrons with specific physical limitations.

7.1.4.5 The limits specified for all axes are for total net acceleration, inclusive of earth’s gravity. A motionless body would therefore have a magnitude of 1 G measured in the axis perpendicular to the earth’s surface, and a 0 G magnitude in the axes parallel to the earth’s surface.

7.1.4.6 Steady state values in the charts are not limited in time unless otherwise specified. Sustained exposure in excess of 90 s has not been addressed by this practice.

7.1.4.7 These limits are provided for the following basic restraints types:

(1) *Base Case (Class-4 or -5 Restraint)*—For the purpose of acceleration limits the Class-4 restraint used as the base case herein also provides support to the lower body in all directions and maintains patron contact with the seat at all times.

(2) *Over-the-Shoulder (Class-5 Restraint)*

(3) *Prone Restraint*—A prone restraint is one in which the patron is oriented face down at a point or points during the ride cycle. A prone restraint is a restraint designed to allow the patron to accept higher acceleration in the -Gx (eyes front) as compared to the base case and over-the-shoulder restraints.

NOTE 1—The patron restraint and containment analysis shall be used to

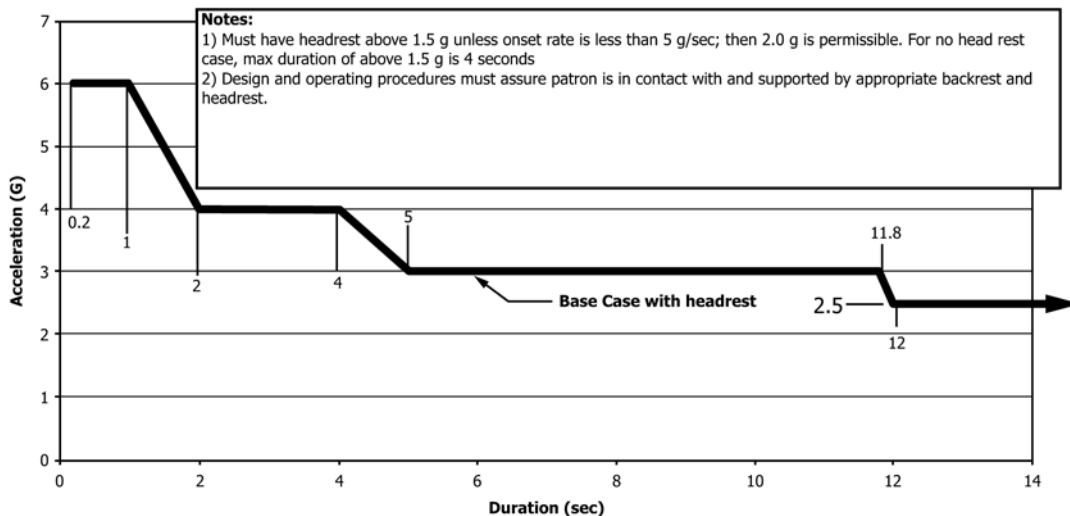

FIG. 6 Acceleration-Duration Limits for +Gx (Eyes Back)

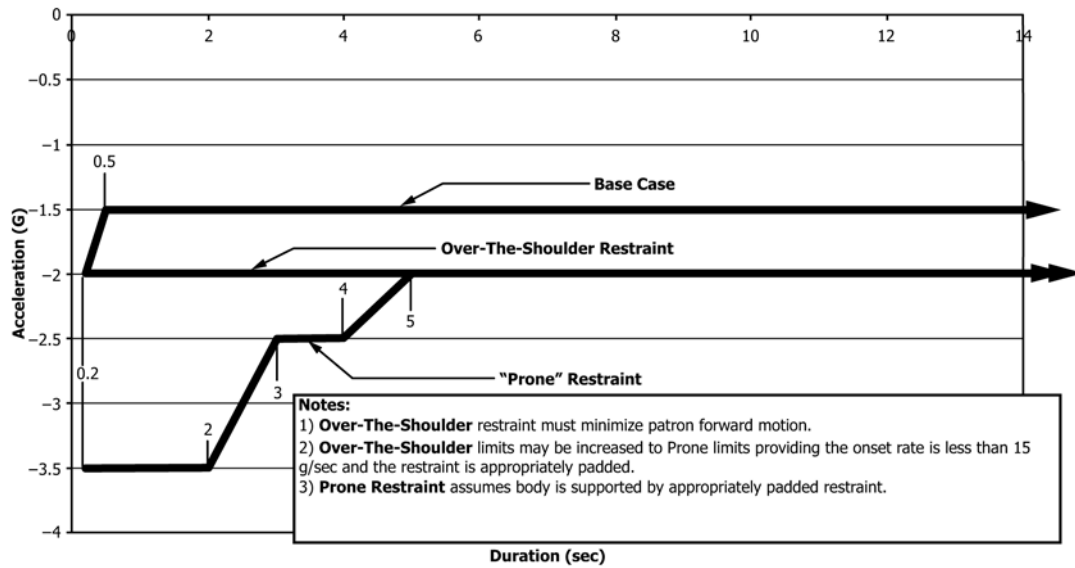

FIG. 7 Acceleration-Duration Limits for  $-G_x$  (Eyes Front)

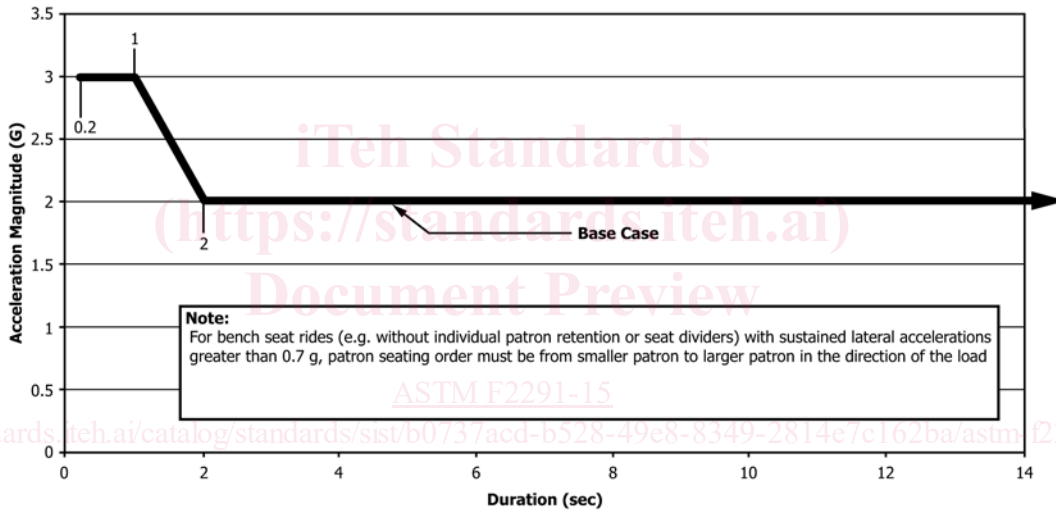

FIG. 8 Acceleration-Duration Limits for  $\pm G_y$  (Eyes Left or Eyes Right)

determine the type of restraint. The type and performance of the restraint system selected may require a reduction in the acceleration limit.

7.1.4.8 The onset at a specific time shall be determined by finding the slope (acceleration/time) of the best linear fit using the least squares approximation through a 100 millisecond window centered at that specific time. Fig. 11 illustrates how to calculate onset. See X2.2 for an example of a method for calculating sustained accelerations.

7.1.5 Simultaneous combinations of single axis accelerations shall be limited as follows:

7.1.5.1 The instantaneous combined acceleration magnitude of any two axes shall be limited by a curve that is defined in each quadrant by an ellipse. The ellipse is centered at (0,0) and is characterized by major and minor radii equal to the allowable 200 ms G limits. Graphical representations of this requirement are presented in Figs. 12-19. Combined accelerations that exceed the limits for less than 200 ms in duration shall be excluded.

NOTE 2—For a given ride, only three of the curves will apply.

7.1.6 Reversals in X and Y accelerations are shown in Fig. 20. The following criteria shall apply:

7.1.6.1 The peak-to-peak transition time between consecutive sustained events in X and Y accelerations shall be greater than 200 ms, as measured by the time between the peaks of the consecutive events. When the elapsed time between consecutive sustained events is less than 200 ms, the limit for the peak values shall be reduced by 50 %.

7.1.6.2 The following examples illustrate such reversal:

7.1.7 *Transitions in Z:*

7.1.7.1 Transition directly from negative (eyes up) limits to positive (eyes down) limits is restricted. If Patrons are exposed to a negative  $G_z$  environment for more than 3 s, then the limits are reduced as shown in the  $+G_z$  limit chart for 6 s after the transition to positive  $G_z$ . After the 6 s period, the limits may be increased to the normal chart levels.

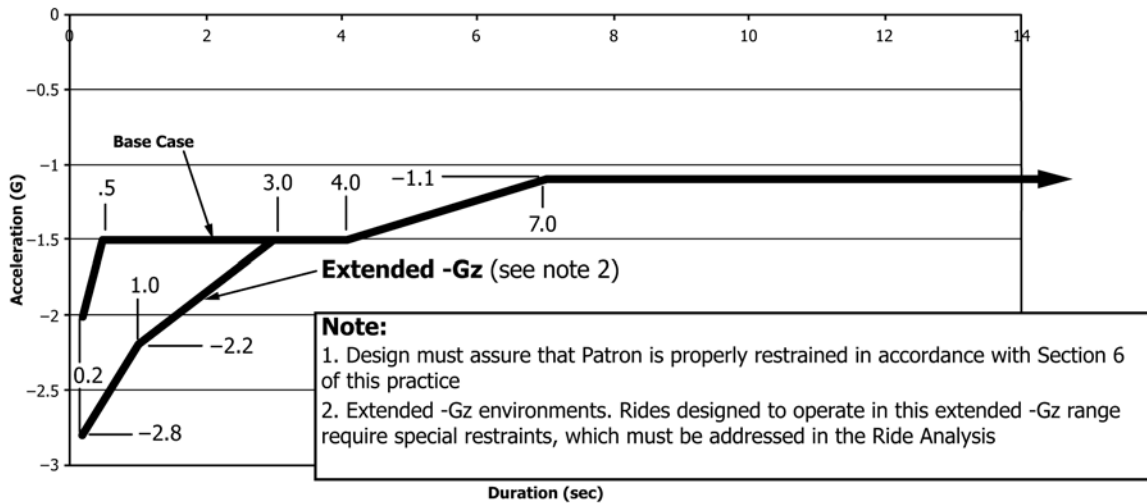

FIG. 9 Acceleration-Duration Limits for -Gz (Eyes Up)

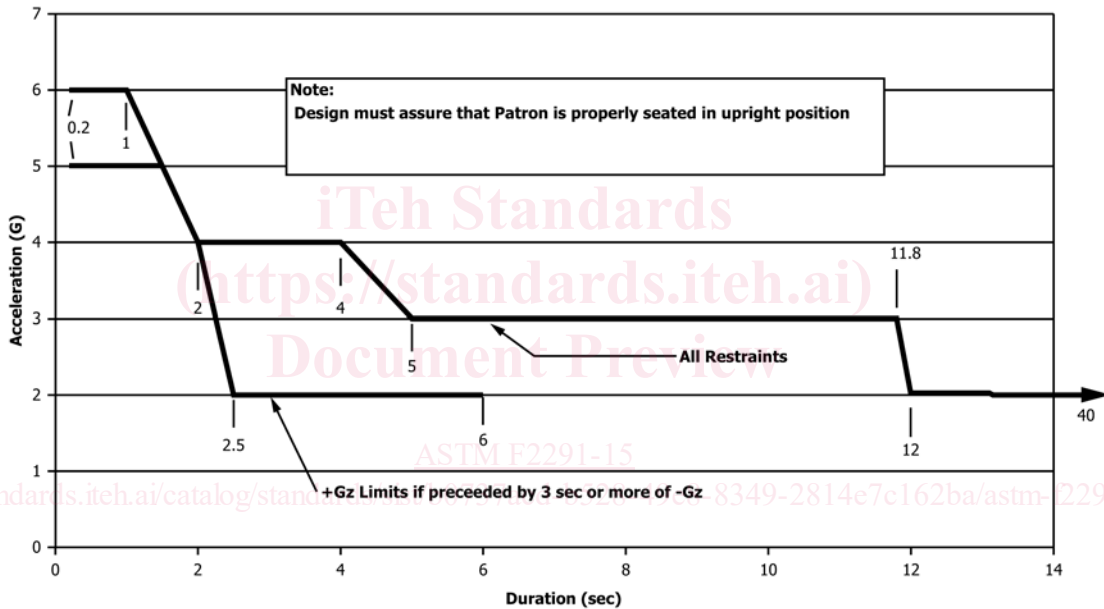

FIG. 10 Acceleration-Duration Limits for +Gz (Eyes Down)

7.1.7.2 Other transitions in Z accelerations are shown in Fig. 21. The following criteria shall apply: When transitioning from sustained weightless (0 G) and more negative levels to 2 G and more positive levels, duration shall be a minimum of 133 ms. Fig. 22(a) illustrates the decision process for applying the Transitions in Z criteria, and Fig. 22(b) contains examples.

## 8. Loads and Strengths

### 8.1 Overview:

8.1.1 This section defines the loads and strengths criteria that shall be applied in the process of design for amusement rides and devices and in the process of design for major modifications made to amusement rides and devices. This criteria is specifically intended for use in determining the loads and strengths of materials, and in performing the calculations and analyses used in the process of design.

### 8.2 General:

8.2.1 Amusement rides and devices shall be designed so that load conditions expected during operation shall not cause failures during the operational hours used in the design per 8.3 and 8.4.

8.2.1.1 In general, amusement rides and devices shall be designed so the expected loading conditions will not cause stresses to exceed the yield strength of the materials (that is, no significant plastic deformation should occur when structures and components are subjected to expected loads). One exception to this generality is that when designed for seismic loads, seismic design allows for the possibility of plastic deformation and relies on connection ductility to absorb energy.

8.2.1.2 A possible exception to 8.2.1 may be made in the case of components and portions of structures that are intended to provide secondary load paths during a failure condition (not to be interpreted as an emergency-stop event). Components such as safety cables or links and certain limited portions of the
