

Designation: **E253–15a** E253 – 15b

Standard Terminology Relating to Sensory Evaluation of Materials and Products¹

This standard is issued under the fixed designation E253; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1.1 *ASTM Standards*:²

E284 Terminology of Appearance

2. Terminology

absolute judgment, *n*—an evaluation of a stimulus made without direct comparison to other stimuli. (2007)

acceptability/unacceptability, *n*—degree to which a stimulus is judged to be favorable or unfavorable. (2006)

acuity, *n*—the ability to detect or discriminate sensory stimuli. (2007)

adaptation, sensory, *n*—a decrease in sensitivity to a given stimulus which occurs as a result of exposure to that stimulus. (2006)

affective test, *n*—any method to assess acceptance, liking, preference, or emotions for a stimulus or stimuli. (2008)

after effects, *n*—total array of sensations that occur after removal of the stimulus from the sensing field (for example, with foods) or after application of the stimulus (for example, with non-foods). (2008)

after feel, *n*—feel of the skin after application of a sample, with or without touching, usually measured at a specified time point. (2008)

aftertaste, *n*—the oral or nasal sensations that occur after the stimulus has been removed from the oral cavity. See **after effects**. (2007)

agusia, *n*—lack of sensitivity to taste stimuli. (1996)

alternative forced choice (AFC), *n*—method in which 2, 3, or more stimuli are presented, and assessors are given a criterion by which they are required to select one stimulus. (2008)

¹ This terminology is under the jurisdiction of ASTM Committee E18 on Sensory Evaluation and is the direct responsibility of Subcommittee E18.01 on Terminology. Current edition approved June 1, 2015/Dec. 1, 2015. Published June 2015/December 2015. Originally approved in 1965. Last previous edition approved in 2015 as E253–15-E253 – 15a. DOI: 10.1520/E0253-15A-10.1520/E0253-15B.

DISCUSSION—

Typical examples include 2-AFC (directional different test) and 3-AFC (selecting the one stimulus among a set of three that differs in a defined attribute).

α (alpha) risk, *n*—the probability of concluding that a perceptible difference exists when, in reality, one does not. (2014)

DISCUSSION—

α risk also is known as Type 1 Error or significance level.

alternative forced choice (AFC) test, *n*—method in which 2, 3, or more stimuli are presented, and assessors are given a criterion by which they are required to select one stimulus. (2008)

DISCUSSION—

Typical examples include 2-AFC (directional difference test) and 3-AFC (selecting the one stimulus among a set of three that differs in a defined attribute).

anchoring point, *n*—a reference point against which other items are judged. (1996)

anosmia, *n*—lack of sensitivity to odor stimuli. (1996)

A-not-A test, *n*—a method of discrimination testing comprised of at least two samples; at least one sample is a previously identified sample (“A”) and at least one is a test sample. All samples are presented blindly, and the assessor’s task is to assign the label “A” or “not-A” to each of the samples. (2001)

antagonism, *n*—joint action of two or more stimuli whose combination elicits a level of sensation lower than that expected from combining the effects of each stimulus taken separately. (1996)

aroma, *n*—perception resulting from stimulating the olfactory receptors; in a broader sense, the term is sometimes used to refer to the combination of sensations resulting from stimulation of the entire nasal cavity. (1996)

DISCUSSION—

Aroma, odor, and smell have the same basic meaning; however, in common usage they may have different connotations.

aromatic, *n*—perception resulting from stimulating the olfactory receptors retronasally. (2010)

assessor, *n*—a general term for any individual responding to stimuli in a sensory test. (2006)

DISCUSSION—

The terms *assessor*, *judge*, *panelist*, *panel member*, and *respondent* all have the same basic meaning, although sometimes different connotations. Usage of these terms varies with the training and experience of the investigator, habit, tradition, personal preference, and other factors.

astringency, *n*—the complex of sensations due to shrinking, drawing, or puckering of the epithelium as a result of exposure to substances such as alums or tannins. (1996)

attitude, *n*—a predisposition to respond in a characteristic way toward a class of objects, concepts, or stimuli. (1996)

attitude scale, *n*—a means for eliciting indications of the attitudes or opinions held, usually on a measuring system using marks or value designations. (1996)

attribute, *n*—a perceived characteristic. (1996)

audition, *n*—the sense of hearing. (1996)

aversion, *n*—a predisposition to avoid a stimulus based on a feeling of discomfort or dislike. (2011)

β (beta) risk, *n*—the probability of concluding that no perceptible difference exists when, in reality, one does. (2014)

DISCUSSION—

β risk also is known as Type II Error.

bias, *n*—a systematic error manifested as a persistent positive or negative deviation of the method average from its accepted true value. (2013)

DISCUSSION—

Bias is a general term for any systematic deviation in a method’s average from its accepted true value. In sensory, there are several commonly used terms that relate to specific types or causes of bias. These include: sensory adaptation, context effect, contrast effect, convergence effect, error of expectation, order effect, position effect, and response bias.

bipolar scale, *n*—scale where the end anchors are semantic opposites and there is an implied or anchored mid-point. (2008)

DISCUSSION—

Examples of semantic opposites are “too thin” to “too thick,” “dislike extremely” to “like extremely.”

bite, chemical, *n*—stinging experienced primarily in the oral cavity as a result of exposure to substances such as highly carbonated beverages. (1997)

- bitter**, *adj*—pertaining to the taste produced by substances such as quinine or caffeine when in solution. (2012)
- blinded**, *adj*—an element of experimental control in which the identity or an aspect of a treatment, condition, or substance is hidden from the participant (single blind) or both the participant and the experimenter (double blind). (2008)
- body (food)**, *n*—the quality of a food or beverage relating either to its consistency, compactness of texture, fullness, flavor, or combination thereof. (1997)
- brightness**, *n*—see **color** (*of an object*). (2001) (For consensus technical definition see **brightness** in Terminology E284).
- burn, chemical**, *n*—perception of irritation resulting from exposure to substances such as ethyl alcohol, acetic acid, and benzoate. The sensation tends to persist after the stimulus is removed. (2013)
- chemesthesis**, *n*—perception derived from chemical stimulation of the skin or other tissues, for example, menthol cooling, ammonia pungency. (2015)
- chroma**, *n*—see **color**. (2001) (For consensus technical definition see **chroma** in Terminology E284).
- color (of an object)**, *n*—the appearance of an object dependent upon the spectral composition of radiant and incident light, the spectral reflectance or transmittance of the object, and the psychological response of the observer. The experience may be described in terms of three attributes: hue, brightness, and chroma. (2001) (For consensus technical definition see **color** in Terminology E284 as defined by Committee E12.)
- hue*—attribute of color related to the wavelength of electromagnetic energy and experienced as “red,” “green,” “blue,” and other elements of the visible spectrum.
- brightness*—aspect of visual perception whereby an area appears to emit more or less light.
- chroma*—experienced as color purity, attribute of color used to indicate the degree of departure of the color from a gray of the same brightness.
- color blindness**, *n*—total or partial inability to differentiate certain hues. (1997)
- consumer**, *n*—the user or potential user of a product or service, who may participate in research tests to provide opinions of products, concepts or services. (2010)
- context effect**, *n*—effect upon the perception of a stimulus arising from its interrelationship with other stimuli in a presentation set. (1997)
- contrast, visual**, *n*—the degree of dissimilarity in appearance of two parts of a field of view seen simultaneously or successively. (1998)
- contrast effect**, *n*—special case of context effect in which the perceived degree of difference between stimuli is exaggerated as a result of their interrelationship. (1997)
- convergence**, *n*—tendency of a stimulus to be perceived as similar to prior stimulus or stimuli. (1997)
- convergence effect**, *n*—special case of context effect in which the perceived degree of difference between stimuli is diminished as a result of their interrelationship. (1997)
- cooling, chemical**, *n*—sensation of reduced temperature experienced as a result of exposure to certain substances such as menthol or anise. The sensation usually persists after the stimulus is removed. (1997)
- cooling, physical**, *n*—sensation of reduced temperature experienced as a result of exposure to thermally cold substances, such as ice; to substances that evaporate rapidly, such as acetone or alcohol; or to substances that have a negative heat of solution, such as crystalline sorbitol. The duration of the sensation is usually limited to the time of direct contact with the stimulus. (1998)
- cutaneous sense**, *n*—any of the senses whose receptors lie in the skin or immediately beneath it (or in the external mucous membranes): contact, pressure, warmth, cold, and pain. (1997)
- descriptive analysis**, *n*—any method to describe and quantify the sensory characteristics of stimuli by a panel of trained assessors. (1998)
- difference limen**, *n*—See **threshold, difference**. (1997)
- directional difference test**, *n*—a paired comparison or 2-AFC (Alternative Forced Choice) method in which assessors select the stimulus from a pair of stimuli that is perceived to be higher or lower in intensity of a specified sensory attribute. (2009)
- discrimination**, *n*—the process of qualitatively or quantitatively differentiating among stimuli. (1998)

discrimination test, *n*—any method to determine if differences among stimuli are perceptible. For example: triangle tests, duo-trio tests, paired comparison tests, etc. (1998)

duo-trio test, *n*—a method of discrimination testing comprised of two coded samples and one identified reference. One of the coded samples and the reference are samples of the same stimulus. The other coded sample is a sample of one other stimulus. The assessor is asked to select which of the two coded samples is different from the reference or which of the two coded samples is the same as the reference. (2012)

DISCUSSION—

Stimuli can represent different lots of products, formulations, or processes, etc.

expectation, error of, *n*—a bias due to preconceived ideas that influences an assessor’s judgment. (1999)

end effect, *n*—effect where the end points of a scale are used less frequently than other scale points. (2014)

expert, *n*—a common term for a person with extensive experience in a product category who performs perceptual evaluations to draw conclusions about the effects of variations in raw materials, processing, storage, aging, etc. Experts often operate alone. (1995) (See also **assessor** and **expert assessor**.)

expert assessor, *n*—an assessor with a high degree of sensory acuity who has experience in the test procedure and established ability to make consistent and repeatable sensory assessments. An expert assessor functions as a member of a sensory panel. (1995) (See also **assessor** and **expert**.)

extended use testing, *n*—sensory or consumer testing of a product over a time period that allows for multiple usage occasions.

flavor, *n*—(1) perception resulting from stimulating a combination of the taste buds, the olfactory organs, and chemesthetic receptors within the oral cavity; (2) the combined effect of taste sensations, aromatics, and chemical feeling factors evoked by a substance in the oral cavity. (2001)

fragrance, *n*—(1) see **aroma**; (2) an aromatic substance. (2011)

DISCUSSION—

The term fragrance is commonly used in household and personal care industries.

free-choice profiling, *n*—a form of sensory profiling in which each assessor independently generates attributes to evaluate a group of samples. The assessors’ attributes may be the same or may differ from sample to sample. The assessors’ sensory profiles are combined statistically (for example, by Generalized Procrustes Analysis) to produce a map of the samples. (2000)

gloss, *n*—a shiny appearance resulting from the tendency of a surface to reflect light energy at one angle more than at others. (2000) (See **reflectance, directional**. For the consensus technical definition, see **gloss** in Terminology E284.)

gustation, *n*—the sense of taste. (2011)

heat, chemical, *n*—sensation of increased temperature resulting from exposure to substances such as capsaicin or hot peppers. The sensation tends to persist after the stimulus is removed.

heat, physical, *n*—sensation experienced as a result of exposure to thermally hot substances such as water above 120°F. The duration of the sensation is usually limited to the time of direct contact with the stimulus.

hedonic scale, *n*—a scale on which liking or disliking of a stimulus is expressed. (2000)

hue, *n*—see **color** (*of an object*). (2001) (For consensus technical definition see **hue** in Terminology E284.)

inadequate stimulus, *n*—a stimulus which is not regarded as normally affecting a particular sense, but which may actually do so (for example, pressure on the eyeball producing a perception of light, or electrical stimulation generating a taste). (2000)

intensity, *n*—the perceived magnitude of a stimulus. (2000)

judge, *n*—See **assessor**. (2000)

just-about-right scale, *n*—bipolar scale used to measure the level of an attribute relative to an assessor’s ideal level, having a midpoint labeled “just about right” or “just right.” (2007)

just noticeable difference, *n*—See **threshold, difference**. (2000)

kinesthesia, *n*—~~perception of pressure, position, or motion in muscles, tendons, or joints.~~ (2001) bodily movement or position. (2015)

labeled affective magnitude scale (LAM), *n*—a type of labeled magnitude scale, with verbal labels related to liking and disliking. There is a neutral point in the center of the line scale and the opposing end anchors are “greatest imaginable like” and “greatest imaginable dislike.” See Fig. 1. (2015)

DISCUSSION—

The remaining verbal anchors are equivalent to the anchors used with the well-known, nine-point hedonic scale, from “like extremely” to “dislike extremely.” Positions of the verbal anchors were determined by magnitude estimation to be (in terms of % of the scale):³

Greatest Imaginable Like	100.0
Like Extremely	87.1
Like Very Much	78.1
Like Moderately	68.1
Like Slightly	55.6
Neither Like nor Dislike	50.0
Dislike Slightly	44.7
Dislike Moderately	34.1
Dislike Very Much	22.3
Dislike Extremely	12.3
Greatest Imaginable Dislike	0.00

labeled magnitude scale (LMS), *n*—a semantic scale of perceptual intensity characterized by approximately logarithmic spacing of verbal labels along a line scale. See Fig. 2. (2015)

³ Cardello and Schutz, “Numerical Scale-Point Location for Constructing the LAM (Labeled Affective Magnitude) Scale,” *Journal of Sensory Studies*, Vol 19, 2004, pp. 341–346.

FIG. 2 Labeled Magnitude Scale

The verbal anchors are spaced on the LMS based on calibration using ratio-scaling. It is critical that the spacing be maintained in order to accurately

FIG. 1 Labeled Affective Magnitude Scale

reflect the nonlinear relationship between stimulus and sensation. Positions of the verbal anchors were determined by magnitude estimation to be (in terms of % of the scale): “barely detectable”, 7.1; “weak”, 38.4; “moderate”, 61.1; “strong”, 76.8; “very strong”, 85.0; and “strongest imaginable”, 100.0.⁴

magnitude estimation, *n*—process of assigning values to the intensities of an attribute in such a way that the ratios between pairs of assigned values are the same as between the magnitudes of the perceptions to which they correspond. (2003)

malodor, *n*—an odor that is unpleasant or disliked when perceived in a specific context. (2012)

⁴ Green, B. G., Shaffer, G. S., Gilmore, M. M., “Derivation and Evaluation of a Semantic Scale of Oral Sensation Magnitude with Apparent Ratio Properties,” *Chemical Senses*, Vol 18 (6), 1993, pp. 683–702.

DISCUSSION—

For example, “sweaty” is considered a malodor by many people when it is present on the human body. However, “sweaty” notes are common in many cheeses and may not be considered malodor in that context.

masking, *n*—the phenomenon where one quality within a mixture obscures one or several other qualities present. (2001)

matching, *n*—the process of equating or relating stimuli, usually to determine the similarity between standard and unknown or between unknowns. (2002)

modality, *n*—any of the sensory systems (for example, auditory, taste, olfaction, touch, or visual modality). (2001)

mouthfeel, *n*—a mixed experience deriving from sensations in the oral cavity that relate to physical (for example, density, particulate) or chemical (for example, astringency, menthol cooling) properties of a stimulus material. (2001)

observer, *n*—(1) an assessor in a visual sensory test. (See also **assessor**.) (2) a person who is watching an individual or group to collect information about behavior, responses to products, test protocols, or processes. (2002)

odor, *n*—See **aroma**. (2001)

odorant, *n*—a substance that stimulates the olfactory receptors. (2002)

olfaction, *n*—the sense of smell. (2011)

olfactory, *adj*—pertaining to the sense of smell. (2001)

order effect, *n*—sequential effects in which one order of evaluating two or more stimuli produces different responses than another order. (2008)

organoleptic, *adj*—relating to a property of a sample perceived by the sense organs (obsolete, see **sensory**). (2001)

paired comparison, *n*—a method in which stimuli are presented in pairs for comparison on the basis of some defined criterion. (2001)

palatable, *adj*—sufficiently pleasant to be consumed. (2003)

panel, *n*—a group of assessors chosen to participate in a sensory test. (2001)

panelist, *n*—See **assessor**. (2001)

panel member, *n*—See **assessor**. (2001)

partial sensory profile, *n*—a profile comprising certain selected attributes with their intensity values. Examples are flavor profile, odor profile, and texture profile. (2001)

perception, *n*—the awareness of a stimulus by way of the senses. (2003)

position effect, *n*—bias occurring as a function of the evaluation of stimuli in the first, second, or third, etc. place or position. (2008)

DISCUSSION—

For example, a first position, or primacy effect is bias related to the evaluation of treatments presented first; alternatively, a recency effect is bias related to treatments presented last.

preference, *n*—choice of one product, treatment, or item over others in a given set based upon hedonics, sensory properties, or other criteria. (2003)
