This document is not an ASTM standard and is intended only to provide the user of an ASTM standard an indication of what changes have been made to the previous version. Because it may not be technically possible to adequately depict all changes accurately, ASTM recommends that users consult prior editions as appropriate. In all cases only the current version of the standard as published by ASTM is to be considered the official document.

## Designation: D5819 - 05 (Reapproved 2012) D5819 - 05 (Reapproved 2016)

## Standard Guide for Selecting Test Methods for Experimental Evaluation of Geosynthetic Durability<sup>1</sup>

This standard is issued under the fixed designation D5819; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\varepsilon$ ) indicates an editorial change since the last revision or reapproval.

## 1. Scope

1.1 This guide covers a designer/specifier through a systematic determination of those factors of the appropriate application environment that may affect the post-construction service life of a geosynthetic. Subsequently, test methods are recommended to facilitate an experimental evaluation of the durability of geosynthetics in a specified environment so that the durability can be considered in the design process.

1.2 This guide is not intended to address durability issues associated with the manufacturing, handling, transportation, or installation environments.

- D5970 Test Method for Deterioration of Geotextiles from Outdoor Exposure

## 3. Summary of Guide

3.1 The effects of a given application environment on the durability of a geosynthetic must be determined through appropriate testing. Selection of appropriate tests requires a systematic determination of the primary function(s) to be performed and the associated degradation processes that should be considered. This guide provides a suitable systematic approach.

<sup>&</sup>lt;sup>1</sup> This guide is under the jurisdiction of ASTM Committee D35 on Geosyntheticsand is the direct responsibility of Subcommittee D35.02 on Endurance Properties.

Current edition approved July 1, 2012 June 1, 2016. Published July 2012 June 2016. Originally approved in 1995. Last previous edition approved in  $\frac{20052012}{10.1520/D5819-05R12}$  as D5819 - 05(2012) DOI:  $\frac{10.1520/D5819-05R12}{10.1520/D5819-05R16}$ .

<sup>&</sup>lt;sup>2</sup> For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For Annual Book of ASTM Standards volume information, refer to the standard's Document Summary page on the ASTM website.

#### TABLE 1 Functions<sup>A</sup> and Other Performance Characteristics<sup>B</sup>

Containment<sup>B</sup>(C)—A geosynthetic provides containment when it encapsulates or surrounds materials such as sand, rocks, and fresh concrete.<sup>C</sup> Filtration<sup>A</sup>(F)—A geosynthetic performs the filtration function when the equilibrium geotextile-to-soil system allows for adequate liquid flow with limited soil loss across the plane of the geotextile over a service lifetime compatible with the application under consideration. Fluid Barrier<sup>A</sup>(FB)—A geosynthetic performs the fluid barrier function when it essentially eliminates the migration of fluids through it. Fluid Transmission<sup>A</sup> (a.k.a. drainage)—A geosynthetic performs the fluid transmission function when the equilibrium geotextile-to-soil system allows for adequate flow with limited soil loss within the plane of the geotextile over a service lifetime compatible with the application under consideration. Insulation<sup>B</sup>(I)—A geosynthetic provides insulation when it reduces the passage of heat, electricity, or sound. Protection<sup>A</sup>(P)—A geosynthetic performs the reinforcement function when it provides often synergistic improvement of a total system's strength created by transmitted to the material to be protected. Reinforcement<sup>A</sup>(R)—A geosynthetic, placed between two materials, performs the provides often synergistic improvement of a total system's strength created by the introduction of a tensile force into a soil (good in compression but poor in tension) or other disjointed and separated material. Screening<sup>B</sup>(Scr)—A geosynthetic, placed across the path of a flowing fluid (ground water, surface water, wind) carrying particles in suspension, provides screen which requires that the screen be able to withstand pressures generated by the accumulated particles and the increasing fluid pressure. Separation<sup>A</sup>(S)—A geosynthetic, placed between dissimilar materials so that the integrity and functioning of both materials can remain intact or be improved performs the separation function. Surface Stabilization<sup>B</sup>(SC)—A geosynthetic, placed on a soil surface, provides surface s

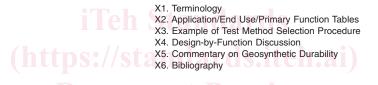

Vegetative Reinforcement<sup>B</sup>(VR)—A geosynthetic provides vegetative reinforcement when it extends the erosion control limits and performance of vegetation.

<sup>A</sup>Functions are used in the context of this guide as terms that can be quantitatively described by standard tests or design techniques, or both.

<sup>B</sup>Other performance characteristics are qualitative descriptions that are not yet supported by standard tests or generally accepted design techniques.

Note-during the placement of fresh concrete in a geotextile flexible form, the geosynthetic functions temporarily as a filter to allow excess water to escape.

3.2 Primary functions of geosynthetics are listed and defined in Table 1. With knowledge of the specific geosynthetic application area and end use, the corresponding primary function(s) is (are) identified. Table 2 gives degradation concerns as they relate to geosynthetic functions. Table 3 gives the environmental elements that relate to the various degradation processes and the currently available ASTM Committee D-35 test method for the experimental evaluation of specific types of geosynthetic degradation. The following appendixes are included to provide background information:

### 4. Significance and Use

4.1 Designers/specifiers of geosynthetics should evaluate geosynthetic durability as an integral part of the geosynthetic specification/selection process. This guide is intended to guide a designer/specifier through a systematic determination of degradation concerns based on the intended geosynthetic function or performance characteristic. This guide then provides a guide to select available test methods for experimentally evaluating geosynthetic durability and to identify areas where no suitable test exists.

4.2 This guide does not address the evaluation of degradation resulting from manufacturing, handling, transporting or installing the geosynthetic.

## 5. Suggested Procedure

5.1 To utilize a structured procedure for selecting appropriate test methods, the geosynthetic designer/specifier must have knowledge of:

- 5.1.1 The intended geosynthetic application,
- 5.1.2 The end use of the geosynthetic via its primary function(s) or performance characteristic(s), or both,
- 5.1.3 The specific environment to which the geosynthetic will be exposed,
- 5.1.4 The types of geosynthetics that may or will be used, and
- 5.1.5 The duration or time of use (that is, service life).

5.2 With this knowledge, the designer/specifier follows the following procedure:

5.2.1 Identify the primary function(s) or performance characteristic(s), or both, to be performed by the geosynthetic in the specific application and end use intended. Functions and performance characteristics are defined in Table 1. (Tables for guidance in identifying primary function(s) and performance characteristics are given in Appendix X2.)

5.2.2 Using Table 2, identify the potential degradation process(es) that will almost always (denoted as "A") or sometimes (denoted as "S") be of concern when a geosynthetic performs the primary function(s) or provides the performance characteristic(s), or both, which were identified in 5.2.1. Annex A1 contains associated notes to Table 2 that help to identify the process(es) that is (are) sometimes a concern in the specific expected application environment.

5.2.3 Using Table 3, select the test method(s) that applies to the potential degradation process(es) identified in 5.2.2 as a concern(s) in the specific application environment expected.

Note 1-Guidance is given in Table 3 to identify the most important elements or variables relating to each degradation process.

<sup>A</sup>Refer to Appendix X1 for terminology relating to Table 2.

<sup>B</sup>M = Not a generally recognized concern; S = Sometimes a concern; A = Almost always a concern; P = Potential concern being researched.

<sup>C</sup>Microorganisms have been known to attack and digest additives (plasticizers, lubricants, emulsifiers) used to plasticize some base polymers. This attack will change physical and mechanical properties. Study is needed to determine relevance to polymers incorporated into geosynthetic products. Embrittlement of geosynthetic surfaces may influence interaction properties.

<sup>D</sup>Microbial enzymes have been known to initiate and propagate reactions deteriorative to some base polymers. Study is needed to determine relevance to polymers used in geosynthetic products.

<sup>E</sup>Chemical degradation or dissolution, or both, including the leaching of plasticizers or additives from the polymer structure, may be a concern for some geosynthetics exposed to liquids containing unusually high concentrations of metals, salts, or chemicals, especially at elevated temperatures.

FIf select fill is not available, then a clogging resistance test should be performed with the job-specific soil.

<sup>G</sup>Geosynthetics in containment structures which require long term strength characteristics should be designed using appropriate creep and stress relaxation criteria.

<sup>H</sup>Hydrolysis may be a concern for polyester (PET) and polyamide (PA) geosynthetics exposed to extreme pH conditions, especially at elevated temperatures.

When subject to rocking (abrasion), puncture (floating or airborne debris), or cutting (equipment or vandalism).

'When permanently exposed or in extended construction phases (>2-4 weeks) and in "wrap-around" construction, photo degradation may be a concern for the exposed

geosynthetic. KGeosynthetics in applications such as dam facings and floating covers which results in exposure to temperatures at or above ambient must be stabilized to resist thermal oxidation.

<sup>L</sup>Clogging resistance of geotextiles can only be assessed by testing with site-specific soil and (sometimes) liquid.

<sup>M</sup>If a filter geotextile is used with a geonet, it is important to assess short-term extrusion and long-term intrusion into the net.

<sup>N</sup>Residual stresses and surface damage may produce synergistic effects with other degradation processes.

<sup>o</sup>Polyethylene geosynthetics may experience slow crack growth under long-term loading conditions in certain environmental conditions.

PExcessive expansion and contraction resulting from temperature changes may be a concern for geosynthetics without fabric reinforcement.

<sup>Q</sup>Composite drains must resist clogging due to soil retention problems and intrusion of filter medium.

<sup>r</sup>Geosynthetics relying on a 3-D structure to facilitate flow must demonstrate resistance to compression creep.

<sup>S</sup>Sufficient thickness must be maintained by a protective layer over an extended period of time.

<sup>7</sup>Chemical dissolution of, or mechanical damage to geosynthetic surfaces or coatings may effect their interaction properties, i.e. lead to surface or joint slippage.

<sup>U</sup>Geosynthetics creep and stress relax at different rates depending primarily on manufacturing process, polymer type, load levels, temperature, and application. <sup>V</sup>Plasticization may be a concern for polyester (PET) geosynthetics exposed to humid conditions or polypropylene and polyethylene geosynthetics exposed to hydrocarbons while under stress.

<sup>W</sup>If the screen is expected to operate indefinitely, then clogging should be assessed often. Commonly, screens are considered temporary.

<sup>x</sup>Holes resulting from mechanical damage may alter the effectiveness of separators.

<sup>Y</sup>Always exposed therefore resistance to photo oxidation and mechanical damage must be determined.

# 🖽 D5819 – 05 (2016)

NOTE 1—This table provides the standard test methods current at the time of the writing of this guide. ASTM Standards are in constant development, review, revision, and replacement. It is the responsibility of the geosynthetic specifier to identify the most current applicable standard test method. Refer to Appendix X1 for terminology relating to Table 3.

## **APPENDIXES**

#### (Nonmandatory Information)

## **X1. TERMINOLOGY**

X1.1 The *application environment*in which a geosynthetic is placed can be characterized by the following environmental elements:

Air Chemistry Fluid Content Geometry of Exposure Liquid Chemistry Organisms (micro- and macro-) Radiation Soil Chemistry Stress Temperature of Exposure Time of Exposure

## Teh Standards

X1.1.1 Air chemistry shall include the identification of the following characteristics of the gases expected to be present or created,

or both: Oxygen content Gaseous pollution (for example, NO<sub>x</sub>, SO<sub>2</sub>) Ozone Organics (for example, methane)

X1.1.2 *Fluid content* is a measure of the amount of liquid or vapor, or both, which is in the environment immediately surrounding the geosynthetic.

X1.1.3 *Geometry of exposure* may be described by: Angle of exposure Degree of exposure (surface versus complete)

X1.1.4 *Liquid chemistry* shall include the identification of the following characteristics of the ground water or leachate: pH

Electrolytic conditions Dissolved/suspended minerals Chemicals B.O.D., C.O.D. D.O.

X1.1.5 *Macro-organisms*—Those which are or could be present in the environment shall be identified. Macro-organisms such as insects, rodents and other higher life forms shall be considered.

X1.1.6 *Micro-organisms*—Those which are or could be present in the environment shall be identified. Possible micro-organisms included:

Bacteria Fungi Algae Yeast

X1.1.7 *Radiation* shall be considered as including: Ultraviolet Radiation Ionizing Radiation Infra-Red and Visible Radiation

X1.1.8 *Soil chemistry* shall include the identification of the following characteristics of the soil or waste:

Transition Metals Soluble Minerals Polarizability Clay Mineralogy

X1.1.9 *Stress* shall be focused upon mechanical forces applied externally to the geosynthetic/soil system, resulting in tensile compressive or shear stresses, or both, on the geosynthetic. Stresses on the geosynthetic shall be described by:

Normal stresses Planar stresses Surface stresses Intensity of stresses How stresses vary with time (static, dynamic, periodic) How stresses are distributed over the geosynthetic

X1.1.10 *Time of exposure* shall be defined by the duration of exposure to any specific set of environmental elements.

X1.1.11 *Temperature of exposure* shall be defined as the temperature of the geosynthetic, which is not necessarily that of the surrounding medium.

X1.2 The *effects* of the application environment are characterized by the following degradation processes:

X1.2.1 *Chemical degradation* is the reaction between a chemical(s) and a specific chemical structure within a polymer resulting in chain scission, and a reduction in molecular weight and physical properties.

X1.2.2 *Chemical dissolution* is the physical interaction between a solvent and polymer whereby the polymer absorbs the solvent, swells, and eventually dissolves.

X1.2.3 *Clogging* is the collection of soil particles, microbiological growth, precipitates, or combination thereof on or within the geosynthetic altering its initial hydraulic properties.

X1.2.4 Creep is the time-dependent part of a strain resulting from an applied stress.

X1.2.5 *Environmental stress cracking* is the deterioration of a polymer's mechanical properties that occurs when cracks created by high stress concentrations are exposed to certain environmental conditions.

X1.2.6 *Hydrolysis* is the degradative chemical reaction between a specific chemical group within a polymer and absorbed water causing chain scission and reduction in molecular weight.

X1.2.7 *Macrobiological degradation* is the attack and physical destruction of a geosynthetic by macroorganisms leading to a reduction in physical properties.
