

Designation: F2027 - 08 F2027 - 16

Standard Guide for Characterization and Testing of Raw or Starting Biomaterials Materials for Tissue-Engineered Medical Products¹

This standard is issued under the fixed designation F2027; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

- 1.1 This document provides guidance on writing a materials specification for raw or starting biomaterials intended for use in tissue engineering scaffolds for growth, support, or delivery of cells and/or biomolecules. This guide does not apply to biomaterials that are already in a scaffold form or are finished tissue-engineered medical products.
- 1.2 The purpose of this guide is to provide a compendium of relevant existing standards and test methods for biomaterialsmaterials already commonly used within medical products and to provide characterization guidance for interim use of raw biomaterials materials for which a standard does not exist.
- 1.3 This guide covers specifications and characterizations of all the major classes of materials including polymers, ceramics, metals, composites, and natural tissues of human, animal, or plant origin. This guide does not apply to pharmaceuticals.
- 1.4 This guide is focused on specification of chemical, physical, and mechanical properties of the raw or starting material. It does not include safety and biocompatibility requirements since safety and biocompatibility testing is typically done on materials fabricated into a final form to include all possible effects of fabrication and sterilization techniques.
- 1.5 Compliance with materials specifications developed in accordance with this standard may not necessarily result in a material suitable for its intended purpose. Additional testing specific to the <u>intendintended</u> use may be required.

F560 Specification for Unalloyed Tantalum for Surgical Implant Applications (UNS R05200, UNS R05400)

F562 Specification for Wrought 35Cobalt-35Nickel-20Chromium-10Molybdenum Alloy for Surgical Implant Applications (UNS R30035)

F563 Specification for Wrought Cobalt-20Nickel-20Chromium-3.5Molybdenum-3.5Tungsten-5Iron Alloy for Surgical Implant Applications (UNS R30563) (Withdrawn 2005)³

F602 Criteria for Implantable Thermoset Epoxy Plastics

F603 Specification for High-Purity Dense Aluminum Oxide for Medical Application

F604 Specification for Silicone Elastomers Used in Medical Applications (Withdrawn 2001)³

F619 Practice for Extraction of Medical Plastics

F624 Guide for Evaluation of Thermoplastic Polyurethane Solids and Solutions for Biomedical Applications

F639 Specification for Polyethylene Plastics for Medical Applications

F641 Specification for Implantable Epoxy Electronic Encapsulants

F648 Specification for Ultra-High-Molecular-Weight Polyethylene Powder and Fabricated Form for Surgical Implants

F665 Classification for Vinyl Chloride Plastics Used in Biomedical Application

F702 Specification for Polysulfone Resin for Medical Applications

F755 Specification for Selection of Porous Polyethylene for Use in Surgical Implants

F755 Specification for Selection of Porous Polyethylene for Use in Surgical Implants

F997 Specification for Polycarbonate Resin for Medical Applications

F1088 Specification for Beta-Tricalcium Phosphate for Surgical Implantation

F1185 Specification for Composition of Hydroxylapatite for Surgical Implants

F1251 Terminology Relating to Polymeric Biomaterials in Medical and Surgical Devices (Withdrawn 2012)³

F1377 Specification for Cobalt-28Chromium-6Molybdenum Powder for Coating of Orthopedic Implants (UNS R30075)

F1472 Specification for Wrought Titanium-6Aluminum-4Vanadium Alloy for Surgical Implant Applications (UNS R56400)

F1537 Specification for Wrought Cobalt-28Chromium-6Molybdenum Alloys for Surgical Implants (UNS R31537, UNS R31538, and UNS R31539)

F1538 Specification for Glass and Glass Ceramic Biomaterials for Implantation

F1579 Specification for Polyaryletherketone (PAEK) Polymers for Surgical Implant Applications (Withdrawn 2011)³

F1581 Specification for Composition of Anorganic Bone for Surgical Implants

F1634 Practice for In-Vitro Environmental Conditioning of Polymer Matrix Composite Materials and Implant Devices

F1635 Test Method for*in vitro* Degradation Testing of Hydrolytically Degradable Polymer Resins and Fabricated Forms for Surgical Implants

F1713 Specification for Wrought Titanium-13Niobium-13Zirconium Alloy for Surgical Implant Applications (UNS R58130)

F1855 Specification for Polyoxymethylene (Acetal) for Medical Applications

F1873 Specification for High-Purity Dense Yttria Tetragonal Zirconium Oxide Polycrystal (Y-TZP) for Surgical Implant Applications (Withdrawn 2007)³

F1876 Specification for Polyetherketoneetherketoneketone (PEKEKK) Resins for Surgical Implant Applications (Withdrawn 2012)³

F1877 Practice for Characterization of Particles

F1925 Specification for Semi-Crystalline Poly(lactide) Polymer and Copolymer Resins for Surgical Implants

F1926F2026 Test Method for Evaluation of the Environmental Stability of Calcium Phosphate CoatingsSpecification for Polyetheretherketone (PEEK) Polymers for Surgical Implant Applications

F2064 Guide for Characterization and Testing of Alginates as Starting Materials Intended for Use in Biomedical and Tissue Engineered Medical Product Applications

F2103 Guide for Characterization and Testing of Chitosan Salts as Starting Materials Intended for Use in Biomedical and Tissue-Engineered Medical Product Applications

F2150 Guide for Characterization and Testing of Biomaterial Scaffolds Used in Tissue-Engineered Medical Products

F2212 Guide for Characterization of Type I Collagen as Starting Material for Surgical Implants and Substrates for Tissue Engineered Medical Products (TEMPs)

F2259 Test Method for Determining the Chemical Composition and Sequence in Alginate by Proton Nuclear Magnetic Resonance (¹H NMR) Spectroscopy

F2260 Test Method for Determining Degree of Deacetylation in Chitosan Salts by Proton Nuclear Magnetic Resonance (¹H NMR) Spectroscopy

F2313 Specification for Poly(glycolide) and Poly(glycolide-co-lactide) Resins for Surgical Implants with Mole Fractions Greater Than or Equal to 70 % Glycolide

F2347 Guide for Characterization and Testing of Hyaluronan as Starting Materials Intended for Use in Biomedical and Tissue Engineered Medical Product Applications

F2579 Specification for Amorphous Poly(lactide) and Poly(lactide-co-glycolide) Resins for Surgical Implants

F2848 Specification for Medical-Grade Ultra-High Molecular Weight Polyethylene Yarns

F3160 Guide for Metallurgical Characterization of Absorbable Metallic Materials for Medical Implants

3. Summary of Guide

- 3.1 Novel materials that do not yet have standards associated with them are being created for use in tissue engineering tissue-engineering applications. The lack of standardized specifications for the physical and chemical properties of these new materials may lead to variation between lots, which could create variation in observed biological performance of the final product. It is the intent of this guide to provide a compendium of existing medical product materials specifications and test methods to serve as a guide for specifying the important chemical and physical properties of new raw or starting materials. Tables of commonly specified chemical, physical, and mechanical requirements are provided for each type of material (for example, ceramic, metal, polymer, composite, natural product) to assist with the development of a specification for a new biomaterial material to be utilized for tissue engineering.
- 3.2 This guide is focused on providing a characterization template for raw or starting materials prior to their fabrication into a scaffold or tissue-engineered medical product. Guidance for the characterization and testing of biomaterials materials after they have been formulated into three-dimensional scaffolds can be found in Guide F2150.

4. Significance and Use

4.1 The physico-chemical characteristics of the raw or starting biomaterial used in regenerative medicine scaffolds carries significant potential to affect product performance by influencing cell behavior and/or the release of bioactive molecules or drugs. This guide describes recommended specifications or characterizations of raw or starting biomaterials to ensure reproducibility prior to their fabrication into implantable tissue engineering tissue-engineering scaffolds and/or controlled release matrices.

5. Classification of Biomaterials Materials

- 5.1 The properties of a biomaterial are a function of whichtissue-engineering scaffolds or cell delivery vehicles are, in part, a function of the type of material from which they are made from. made. All materials can be classified according to their atomic content and bonding as either a ceramic, polymer, metal, or composite. Ceramics consist of ionically or covalently bonded metallic and non-metallic elements such as calcium phosphate or aluminum phosphate and include minerals and glasses, sintered or unsintered. Polymers consist of a repeating backbone structure. Metals are made of metallic elements bonded together by metallic bonds. Composites are blends of any of the three main types of materials. Even materials derived from natural sources such as anorganic bone or chitosan fall into one of these basic types; anorganic bone is a ceramic and chitosan is a polymer.
- 5.2 To use this guide, first classify the material into one of the <u>types above</u>. <u>basic material types listed in 5.1</u>. Important properties that should be specified are listed and tabulated according to material type in <u>Table 1</u> and <u>Table 2</u>. <u>ISO 10993-18 also provides a framework for the identification of a material and the identification and quantification of its chemical constituents.</u>

6. Chemical Requirements

- 6.1 Chemical Requirements for Ceramics—The raw or starting material shall have specifications for relevant chemical properties such as, but not limited to, those listed within Table 1, Col. 1. This includes, for ceramics: chemical formula or composition, requirements for the major and minor elemental constituents, phase content, and processing aids.
- 6.2 Chemical Requirements for Metals—The raw or starting material shall have specifications for relevant chemical properties such as, but not limited to, those listed within Table 1, Col. 2. The composition, trace elements analysis, phase content, and any surface modification (for example, pickled, ground, polished, acid-etched) should be specified quantitatively. Corrosion susceptibility should be tested.
- 6.3 Chemical Requirements for Polymers—The raw or starting material shall have specifications for relevant chemical properties such as, but not limited to, those listed within Table 1, Col. 3. In addition to specifying the chemical formula or composition, and requirements for the major and minor elemental constituents, the following aspects should be expressed quantitatively: viscosity (molecular weight), co-polymer ratio (if appropriate), synthesis method, source (if naturally harvested), additives, fillers, unreacted monomer content, curing agents, catalysts, accelerators, initiators, concentration (if supplied in solution), stability, extractables, and degradation products, mechanism and kinetics. ISO 10993-9 provides guidance on identification and quantification of potential degradation products and ISO 10993-17 provides guidance on allowable limits for leachable substances. Tests for residual moisture or solvent content should be performed. Acceptable sterilization methods should be determined.

TABLE 1 Typically Specified Chemical Requirements for Each Type of Material

Note 1—Natural materials made of proteins, nucleic acids, or polysaccharides are classified as polymers, so the chemical requirements listed for polymers apply. Anorganic bone and other naturally occurring inorganic substances are classified as ceramics, so the chemical requirements listed for ceramics apply.

| Ceramics | Metals | Polymers | Composites |
|--|--|--|---|
| Chemical formula or composition | Chemical formula or composition | Chemical formula or composition | Chemical formula or composition |
| Phase content | Phase content | Unreacted monomer content | Phase content |
| Purity | Purity | Synthesis method | Characterization of the bonding process between phases |
| Major and minor elemental constituents | Major and minor elemental constituents | Source, if naturally harvested | Chemical content at the interface |
| Processing aids (dispersing agents, binders) | Corrosion susceptibility | Viscosity (molar mass) | All other properties listed in this table that may apply based on the type of materials used in the composite material. |
| Allowable % of foreign material contaminants | Surface modification | Additives, fillers, contaminants | |
| | | Curing agents, catalysts, initiators, accelerators | |
| | | Co-polymer ratio, if appropriate | |
| | | Extractables | |
| | | Degradation products, mechanism and kinetics | |
| | | Residual moisture or solvent content | |
| | | Contact angle—surface tension | |
