## FOREWORD

ISO (the International Organization for Standardization) is a worldwide federation of national standards institutes (ISO member bodies). The work of developing International Standards is carried out through ISO technical committees. Every member body interested in a subject for which a technical committee has been set up has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work.

Draft International Standards adopted by the technical committees are circulated to the member bodies for approval before their acceptance as International Standards by the ISO Council.

International Standard ISO 3958 was drawn up by Technical Committee ISO/TC 22, Road vehicles, and was circulated to the member bodies in October 1975.
(standards.iteh.ai)
It has been approved by the member bodies of the following countries :
ISO 3958:1977

# Road vehicles - Passenger cars - Driver hand control reach 

## 0 INTRODUCTION

The hand-reach envelopes described in this International Standard were developed using data acquired from test subjects performing reach tasks in test fixtures simulating a range of actual vehicle configurations ${ }^{[1][2]}$. The test subjects included equal numbers of men and women selected to represent the driving population on the basis of standing height and age, and were tested with upper torso three-point restraint (a diagonal non-extending shoulder strap independent of the lap strap).
The envelopes constructed using the safety belt described above are meant to define a restrained reach.

The hand-reach envelopes are three-dimensional surfaces described in tabular form and can be referenced to a particular vehicle seating configuration according to the procedures described in clauses 4 and 5 teh. ai/catalog/standards/sist/d

2e58493da7ae/iso-3958-19

## 1 SCOPE

This International Standard defines the boundaries of road vehicle hand control locations that can be reached by desired proportions of different driver populations.

## 2 FIELD OF APPLICATION

2.1 This International Standard applies to passenger cars
 the initial design stages of a new vehicle programme. Its application for checking purposes in actual vehicle prototype seat models will take into account the allowable tolerance for the H -point.
2.2 The hand-reach envelopes are directly applicable to left-hand drive motor vehicles designed for seated operators in full-width or single-width seats having fore-and-aft seat adjustment approximately horizontal. Application to right-hand drive vehicles is assumed to be symmetrically opposite.
2.3 The hand-reach envelopes are directly applicable for a three-finger grasping reach to a forward-mounted control knob of 25 mm diameter mancuvred horizontally in the fore-and-aft direction. For reach to finger-operated controls or for reach to controls grasped by the whole hand, incremental adjustments are required.

## 3 DEFINITIONS

3.1 driver hand-reach capability: The maximum reach capability of drivers in a simulated driving situation with the non-reaching hand on the steering wheel and the right foot on the accelerator pedal.
3.2 basic reach task: The hand-reach to a forwardmounted control with the control held in a three-finger grasp (see figure 1 ). $\mathrm{b5f3}$ -
$-1977$

This diagram represents a three-finger grasping reach to a 25 mm ( 1.0 in ) diameter control knob. All measurements for the hand-reach envelope are referenced to the centre of the control knob face.

FIGURE 1 - Three-finger grasping reach
3.3 hand-reach envelope: A geometric description of the hand-reach capability for a specified position of a driver population and type of torso-restraint system.

[^1]3.4 interior dimensions: The characteristics of seat geometry are described in terms of the R-point (see figure 2). The interior dimensions are measured with the front seat in the rearmost normal driving position as specified by the manufacturer. All adjustable features, such as vertical seat adjustment or an adjustable steering wheel, are set in the design position according to the manufacturer's specifications. When the seat back has an angular adjustment separate from the seat cushion, the normal driving seat back angle is specified by the manufacturer. Positions of adjustable features other than horizontal seat adjustment, when not specified by the manufacturer, will be the middle of their adjustment range.

All interior dimensions shown in figure 2 are measured to the vertical and horizontal body zero planes by setting up the vehicle relative to the front and rear fiducial mark ${ }^{1}$ ) heights with respect to the vehicle attitude specified by the manufacturer.
3.5 R-point ${ }^{2)}$ : The seating reference point. It is the pivot centre of the torso line and thigh centreline on the twodimensional H-point machine template with $95 \%$ leg lengths used to describe vehicle seating geometry.
3.6 H-point ${ }^{2)}$ : The pivot centre of the torso line and thigh centreline of the three-dimensional H -point machine installed in the rearmost normal driving position of the operator's seat as specified by the manufacturer.
3.7 accelerator heel-point : The intersection of the heel of the two- or three-dimensional H -point device with the surface of the depressed floor covering; the foot of the device is allowed to depress the accelerator pedal through some proportion of its travel as specified by the manufacturer. The foot angle of the device is restricted to not less than $87^{\circ}$.

FIGURE 2 - Vehicle seating configuration

[^2]3.8 back angle ( $\beta$ ) : The angle, in degrees, between a vertical line through the R-point and the torso line.
3.9 hip angle $(\gamma)$ : The angle, in degrees, between the torso line and the thigh centreline.
3.10 horizontal R-point to heel-point $\left(H_{x}\right)$ : The horizontal dimension from the R-point to the operator heel-point.
3.11 vertical R-point to heel-point $\left(H_{Z}\right)$ : The vertical dimensions from the R-point to the operator heel-point.
3.12 horizontal R-point travel : The horizontal dimension between the R-point and the foremost designed H-point.
3.13 steering wheel diameter $(D)$ : The maximum outside diameter of the steering wheel. If the steering wheel is not round, assume twice the largest swept radius.
3.14 steering wheel angle $(\alpha)$ : The angle, in degrees, that the steering wheel surface plane makes with the vertical.
3.15 wheel centre to heel-point, horizontal $\left(W_{x}\right)$ : The distance from the operator heel-point to the centre of the steering wheel in the plane tangent to the steering wheel rim.

## (standards it

 3.16 wheel centre to heel-point, vertical $\left(W_{z}\right)$ : The distance from the operator heel-point to the centre of the steering wheel in the plane tangent to the steeting wheel rim.https:/standards.teh.ai/catalog/standards/sist

## 2e58493da7ae/iso-3958

3.17 centreline of occupant (C/LO): A vertical plane passing longitudinally through the centre of the operator's station.
3.18 general package factor $(G)$ : A single index value resulting from an algebraic equation that expresses in summarized form the geometry of a particular vehicle seating configuration.

It is a synthesized variable that provides a quantitative index of a vehicle's workspace geometry. The $G$-value for a vehicle can be calculated by substituting the principal package dimensions describing the vehicle seating configuration as shown in figure 2 into the following equation (for computations using millimetres and degrees) :

$$
\begin{aligned}
G= & 0,0018 H_{z}-0,0197 \beta+0,0027 D+0,0106 \alpha- \\
& -0,0011 W_{x}+0,0024 W_{z}+0,0027 \gamma-3,0853
\end{aligned}
$$

3.19 hand-reach reference plane (HR plane) : A vertical reference plane extending laterally across the vehicle, used to properly position the hand-reach envelopes with respect to the geometry of the vehicle seating configuration. The
horizontal location of the HR plane rearward of the accelerator heel-point is determined by application of the general package factor ( $G$ ). (See 4.4.)

## 4 REQUIRED CHARACTERISTICS

4.1 The following list establishes the ranges of the operator workspace dimensions for which these envelopes are applicable. Application to vehicles whose dimensions are outside these ranges shall be made with the necessary corrections.

| Back angle $(\beta):$ | 9,0 to $33,0^{\circ}$ |
| :--- | :--- |
| Vertical R-point to heel-point $\left(H_{z}\right):$ | 130 to 520 mm |
| Horizontal R-point travel : | 130 mm min. |
| Steering wheel diameter $(D):$ | 330 to 600 mm |
| Steering wheel angle $(\alpha):$ | 10,0 to $70,0^{\circ}$ |
| Wheelcentre to heel-point, horizontal $\left(W_{\chi}\right): 660$ to 152 mm |  |
| Wheel centre to heel-point, vertical $\left(W_{z}\right): 530$ to 838 mm |  |

4.2 The envetopes describe the boundaries of control locations that can be reached by at least $95 \%$ of certain driver populations that include mixtures of 50/50, 75/25 and $90 / 10$ male/female driver population ratios. The envelopes for each of these categories are described as referenced in a fore-and-aft direction to specified seating co-ordinates. The envelopes extend from 400 mm outboard to 600 mm inboard of the operator centreline and from -100 mm below the H -point to 800 mm above the H -point. See figure 3. Information concerning controls located not more than 130 mm outside this region may be extrapolated from the tables using for example conventional graphical or analytical methods which take account of the curvature and shape of the envelope.
4.3 Hand-reach envelopes are provided in tables 1 to 21 for seven different seating configurations and three male/ female driver population ratios. The selection of an envelope for a vehicle is based on the calculated value of the general package factor ( $G$ ) and the identification of the male/ female driver population ratio appropriate for the vehicle.
4.4 The hand-reach envelope is located in the vehicle by employing a relationship that utilizes the value of the general package factor $(G)$. The horizontal component of a point on the envelope is measured as the distance forward of a hand-reach reference plane. The fore-and-aft location of this plane rearward from the accelerator heel-point is determined, in millimetres, from the value of the general package factor ( $G$ ) from the formula :

$$
d=H R^{1)}=786-99 G
$$

[^3]
## 5 PROCEDURE FOR USING THE HAND-REACH ENVELOPES

### 5.1 Reference planes ${ }^{1)}$

The envelopes are located in the vehicle according to a set of orthogonal reference planes : a horizontal elevation reference plane through the R-point of the rearmost normal driving position, the lateral HR plane, and a vertical plane extending along the C/LO and parallel to the plane of symmetry of the vehicle.

### 5.2 Establish a reference origin

5.2.1 Specify the dimensions describing the geometry of the vehicle seating configuration and calculate the value of the general package factor $(G)$ as indicated in 3.18.
5.2.2 Calculate HR from the value of the general package factor $(G)$ as indicated in 4.4. Determine the longitudinal location of the hand-reach reference plane.
5.2.2.1 If $\left(H R-H_{x}\right)$ is less than zero, the hand-reach reference plane is located longitudinally at a distance (HR) rearward of the accelerator heel-point.
iTeh STANDARD PREVIEW
5.2.2.2 If $\left(H R-H_{x}\right)$ is greater than zero, the hand-reach reference plane is located longitudinally at the (R-point of al BlBLIOGRAPHYRI)
the rearmost normal driving position. the rearmost normal driving position.

### 5.3 Identify the appropriate hand-reach envelope

21, identify the hand-reach
5.3.1 Referring to tables 1 to 21 , identify the hand-reach envelope appropriate for the value of the general package factor ( $G$ ) calculated for this vehicle and the specified driver population.
5.3.2 Determine the lateral locations of the controls of interest. These locations will be described as lateral locations from the C/LO. Determine the height of the control above the horizontal elevation reference plane described in 5.1.

### 5.4 Determine if the control is within reach ${ }^{2)}$

5.4.1 The limiting value of reach can be read from the appropriate table at the designated elevation and station locations. Interpolation may be required if the necessary locations are not included in the table. Interpolate laterally first before interpolating vertically. Curvilinear interpolations should be made using two locations on either side of the desired control.
5.4.2 The contour of the hand-reach envelope refers to the geometric centre of the control knob face. If the control knob face is at, or rearward of, the contour, it is estimated that at least the specified proportion of the indicated driver population can reach and operate the control.

#### Abstract

Horizontal reach forward of the HR reference plane at stations located laterally from the centreline of operator (C/LO) and at elevations above the rearmost H-point. The envelope describes a $95 \%$ level of performance of a driver population composed of $90 \%$ male and $10 \%$ female drivers wearing a three-point restraint (see clause 0)

[^0]:    Descriptors : human factors engineering, road vehicles, passenger vehicles, hand reach, manual controls, layout, appointments.

[^1]:    1) ISO 3833, Road vehicles - Types - Terms and definitions.
[^2]:    1) See ISO 4130, Road vehicles - Three-dimensional reference system and fiducial marks - Definitions. (At present at the stage of draft.)
    2) New definitions and determinations of points $R$ and $H$ are at present being studied by Sub-committee ISO/TC 22/SC 13, Ergonomics applicable to road vehicles.
[^3]:    1) The dimension $H R$ is not the dimension from the " $H$ " point to the " $R$ " point.
[^4]:    1) The reference planes are defined as planes perpendicular to the three-dimensional reference system. An International Standard is in preparation.
    2) The blank areas in the hand-reach tables are regions where hand-reach was not measured or where design limit values could not be established. The areas enclosed by broken lines are regions where the difference between the hand-reach model and the observed design limit values exceeded 25 mm . The hand-reach values shown in these areas should be used with caution.
