

Designation: **E649 – 00 (Reapproved 2011) E649 – 17**

Standard Test Method for Bromine in Chlorine¹

This standard is issued under the fixed designation E649; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope~~Scope~~*

1.1 This test method covers the determination of bromine in liquid chlorine and in gaseous chlorine with a lower limit of detection of 4 ug/kg by weight.

1.2 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.* Specific hazard statements are given in Section 7.

1.3 Review the current ~~Materials~~–Safety Data Sheets (~~MSDS~~)(SDS) for detailed information concerning toxicity, first-aid procedures, handling, and safety precautions.

2. Referenced Documents

2.1 *ASTM Standards:*²

D1193 Specification for Reagent Water

E180 Practice for Determining the Precision of ASTM Methods for Analysis and Testing of Industrial and Specialty Chemicals (Withdrawn 2009)³

E200 Practice for Preparation, Standardization, and Storage of Standard and Reagent Solutions for Chemical Analysis

3. Summary of Test Method

3.1 Chlorine gas is sampled by absorption in aqueous sodium hydroxide (NaOH). Liquid chlorine is first vaporized, and the vapor is absorbed in aqueous sodium hydroxide. An aliquot of the sample solution is reduced with an excess of sulfite ion, acidified, and excess sulfur dioxide (SO₂) boiled out. In a carefully buffered solution, bromide is oxidized to bromate by hypochlorite. Excess hypochlorite is reduced to chloride by formate. In the presence of molybdate catalyst, bromate is reduced to bromide by iodide, and the liberated iodine is titrated with standard sodium thiosulfate solution.

4. Significance and Use

4.1 Low levels of bromine contaminant in chlorine cause problems in some industrial uses. This test method may be used to determine bromine in liquid or gaseous chlorine at levels as low as 4 ug/kg.

5. Apparatus

5.1 The construction of the chlorine gas sampling apparatus and of the assembled sampling equipment is shown in **Figs. 1 and 2**. Modification of the equipment to deal with special sampling circumstances may be necessary. In **Fig. 2**, the control valve is shown with an adaptor for connection to a chlorine cylinder valve. Other adaptors will be required when sampling liquid chlorine in liquefaction plant streams or from large shipping or storage containers.

5.2 A 10-mL buret calibrated in 0.05-mL divisions is used when titrating with 0.01 *N* standard sodium thiosulfate solution.

¹ This test method is under the jurisdiction of ASTM Committee **D16** on Aromatic Hydrocarbons and Related Chemicals and is the direct responsibility of Subcommittee **D16.16** on Industrial and Specialty Product Standards.

*A Summary of Changes section appears at the end of this standard

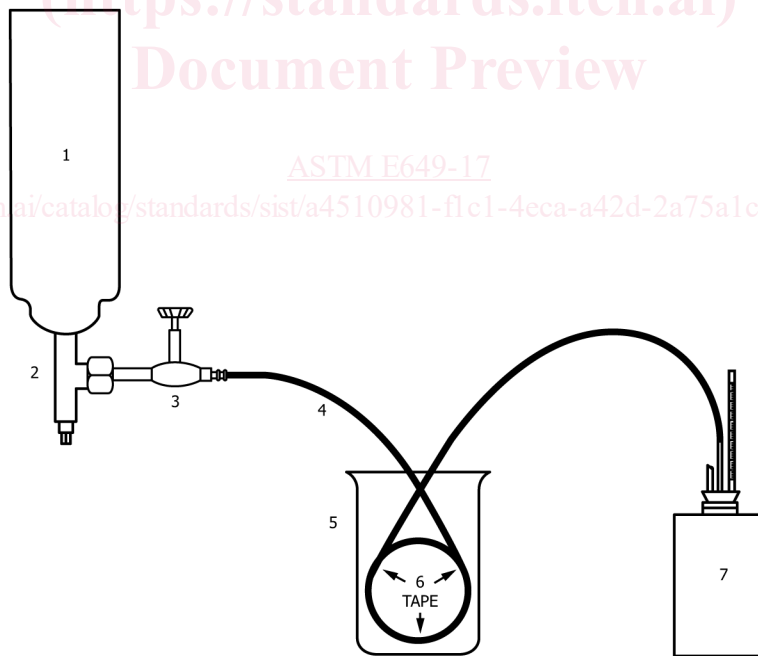

FIG. 1 Chlorine Gas Sampling Apparatus

1. Inverted liquid chlorine cylinder
2. Chlorine cylinder valve
3. Control valve (1/4-in. 316 stainless steel needle valve)
4. 1/4-in. PTFE instrument air tubing
5. Small pail or 2-L beaker filled with water
6. Evaporating coil (two loops held with tape at indicated points)
7. Gas sampling apparatus of Fig. 1

FIG. 2 Liquid Chlorine Sampling Equipment

6. Reagents

6.1 *Purity of Reagents*—Unless otherwise indicated, it is intended that all reagents should conform to the specifications of the Committee on Analytical Reagents of the American Chemical Society, where such specifications are available.⁴ Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lessening the accuracy of the determination.

6.2 *Purity of Water*—Unless otherwise indicated, references to water shall be understood to mean Type II or Type III reagent water conforming to Specification **D1193**.

6.3 *Chloride Solution*—Dissolve 200 g of sodium chloride (NaCl) in 940 mL of water.

6.4 *Formate Solution*—Dissolve 50 g of sodium formate in 175 mL of water.

6.5 *Hypochlorite Solution*—Dissolve 6.2 g of NaOH in 190 mL of water and chlorinate slowly, with stirring, to give a gain in weight of 5.0 g.

NOTE 1—If desired, a commercial hypochlorite bleach solution may be used as the hypochlorite solution. Although such commercial bleach solutions are not made from reagent grade chemicals, the reagent blank determination (see 9.4) corrects for the bromine and any chlorate content in such solutions. A proprietary 5.25 % sodium hypochlorite bleach solution is satisfactory for this use. Because the sodium chloride and hypochlorite solutions contribute most to the reagent blanks, dispense these solutions by pipet to ensure uniformity of blanks and determinations (see 9.1 and 9.2).

6.6 *Molybdate Solution* (44 g/L)—Dissolve 4.4 g of ammonium molybdate (NH₄)₆Mo₇O₂₄·4H₂O in 10 mL of 6 N ammonium hydroxide (NH₄OH) and dilute with 90 mL of water.

6.7 *Phenolphthalein Indicator Solution* (1 g/L)—Dissolve 0.1 g of phenolphthalein and 0.1 g sodium carbonate (Na₂CO₃) in 5 mL of water and dilute to 100 mL.

6.8 *Phosphate Solution* (100 g/L)—Dissolve 50 g of monobasic sodium phosphate (NaH₂PO₄·H₂O) in 500 mL of water.

6.9 *Sodium Hydroxide Solution* (10 %)—Dissolve 1 part by weight of sodium hydroxide (NaOH) in 9 parts of water.

6.10 *Sodium Thiosulfate, Standard Solution* (0.01 N)—Prepare 0.01 N sodium thiosulfate solution fresh daily by accurate dilution of standard 0.1 N sodium thiosulfate solution. Prepare, standardize, and restandardize 0.1 N sodium thiosulfate solution in accordance with Practice **E200**.

6.11 *Starch Solution* (10 g/L)—Dissolve 1 g of soluble starch in 100 mL of boiling water. Make up fresh daily.

6.12 *Sulfuric Acid* (6 N)—Add slowly and cautiously with constant stirring, 1 volume of concentrated sulfuric acid (sp gr 1.84, H₂SO₄) to 5.5 volumes of water. **Warning:** Use goggles when preparing this solution. Cool to room temperature before use.

6.13 *Sulfuric Acid* (1 + 1)—Add slowly with stirring 1 volume of concentrated sulfuric acid (H₂SO₄, sp gr 1.84) to 1 volume of water. **Warning:** Use goggles when preparing this solution.

7. Hazards

7.1 Concentrated sulfuric acid, sodium hydroxide, and sodium hypochlorite solutions are rapidly corrosive to skin and eyes. In case of accidental contact with skin, immediately flush affected part with large volumes of water. For eyes, immediately flush with water for at least 15 min; then get prompt medical attention. Goggles should be worn when handling these chemicals.

7.2 Chlorine sampling should be performed only by persons thoroughly familiar with handling this material and with operation of the sampling system. Personnel should be equipped with a respirator, goggles, faceshield, and gloves. If possible, perform sampling in a hood or other well-ventilated area. In sampling liquid chlorine, do not leave the space between two closed valves filled with liquid chlorine (see 8.6).

7.3 When sampling and working with chlorine out of doors, people downwind from such operation should be warned of the possible release of chlorine vapors.

7.4 It is recommended that means be available for disposal of excess chlorine in an environmentally safe and acceptable manner. If chlorine cannot be disposed of in a chlorine-consuming process, a chlorine absorption system should be provided. When the analysis and sampling regimen requires an initial purging of chlorine from a container, the purged chlorine should be similarly handled. Purging to the atmosphere should be avoided.

7.5 In the event chlorine is inhaled, first aid should be summoned immediately and oxygen administered without delay.

7.6 Chlorine is a corrosive and toxic material. A well-ventilated fume hood should be used to house all test equipment when this product is analyzed in the laboratory.

⁴ *Reagent Chemicals, American Chemical Society Specifications*, American Chemical Society, Washington, DC. For suggestions on the testing of reagents not listed by the American Chemical Society, see *Analar Standards for Laboratory Chemicals*, BDH Ltd., Poole, Dorset, U.K., and the *United States Pharmacopeia and National Formulary*, U.S. Pharmacopeial Convention, Inc. (USPC), Rockville, MD.
