Descriptors : architecture, buildings, engineering drawings, reinforcing bars, codes, reinforcing bar schedule.

Price based on 7 pages

FOREWORD

ISO (the International Organization for Standardization) is a worldwide federation of national standards institutes (ISO member bodies). The work of developing International Standards is carried out through ISO technical committees. Every member body interested in a subject for which a technical committee has been set up has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work.

Draft International Standards adopted by the technical committees are circulated to the member bodies for approval before their acceptance as International Standards by the ISO Council.

International Standard ISO 4066 was developed by Technical Committee ISO/TC 10, *Technical drawings*, and was circulated to the member bodies in August 1976.

(standards.iteh.ai)

It has been approved by the member bodies of the following countries :

Belgium
Canada
Chile
Denmark
France
India

Italy
Mexico
Norway
Romania
Sweden
Switzerland

ISO 4066:1977

Turkey

United Kingdom

U.S.S.R.

Yugoslavia

The member bodies of the following countries expressed disapproval of the document on technical grounds :

Germany
Netherlands
South Africa, Rep. of

Building and civil engineering drawings — Bar scheduling

iTeh STANDARD PREVIEW (standards.iteh.ai)

0 INTRODUCTION

The purpose of this International Standard is to ensure uniformity of practice in the scheduling of steel bars for the reinforcement of concrete. To establish a clear and unambiguous system for scheduling, it is necessary to specify the method of indicating dimensions to be used and the order in which the information is given on the bar schedule.

As the use of preferred shapes is considered to be very advantageous both for simplifying design and manufacture and for the use of computers, the opportunity has been taken to include a list of preferred shapes and a coding system; the layout of the bar schedule is based on the use of preferred shapes.

1 SCOPE

This International Standard establishes a system for the scheduling of reinforcing bars, and comprises

- the method of indicating dimensions;
- a coding system for bar shapes;

— a list of preferred shapes;

— the bar schedule.

2 FIELD OF APPLICATION

This International Standard applies to all types of steel bar for the reinforcement of concrete.

Steel fabric and prestressing steel reinforcement are excluded.

3 METHODS OF INDICATING BENDING DIMENSIONS

The bending dimensions shall be indicated as shown in figures 1 to 5.

Dimensions shall be outside dimensions, except for radii, and the standard radius of bend shall be the smallest radius permitted by national standards or regulations.

The total length (cutting length) shall be calculated on the basis of the appropriate bending dimensions with corrections for bends and allowances for anchorages.

BENDING DIMENSIONS

4 CODING SYSTEM FOR BAR SHAPES

The shape code number consists of two or, if essential, three or four characters, as defined in table 1.

TABLE 1 — Code number composition

First character	Second character	Third character	Fourth character
0 — No bends (optional)	0 — Straight bars (optional)	0 — No end anchorage (optional)	S — Where a national standard specifies a special radius of bend (for example stirrups, links) this shall be indicated by use of the character S.
1 — 1 bend	1 — 90° bend(s) of standard radius all bent in the same direction	1 — End anchorage at one end, as defined in national standards	
2 — 2 bends	2 — 90° bend(s) of non-standard radius, all bent in the same direction	2 — End anchorages at both ends, as defined in national standards	
3 — 3 bends	3 — 180° bend(s) of non-standard radius, all bent in the same direction		
4 — 4 bends	4 — 90° bends of standard radius not all bent in the same direction		
5 — 5 bends	5 — Bends < 90°, all bent in the same direction		
6 — Arcs of circles	6 — Bends < 90°, not all bent in the same direction		
7 — Helices	7 — Arcs or helices		
81 to 89 — Shapes defined in national standards.			
99 — Special non-standard shapes defined by a sketch. It is recommended that code shapes 99 for all non-standard shapes be used. However, the numbers 91 to 99 are available for countries which require more than one number for special shapes.			

NOTE — This table explains the logic behind the numbering of the shapes in table 2. It is not to be used for making up codes for additional shapes.

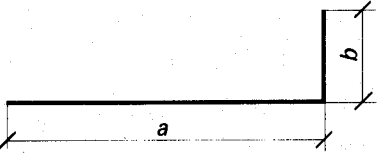

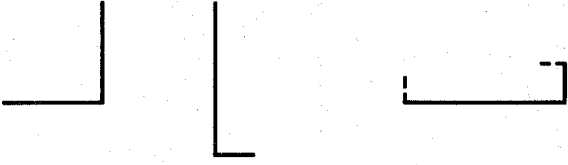

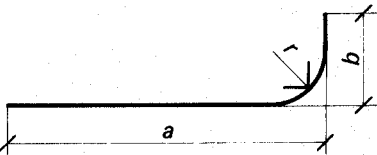

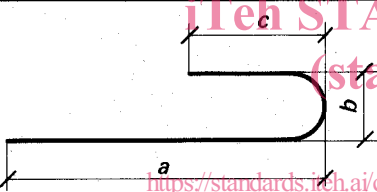

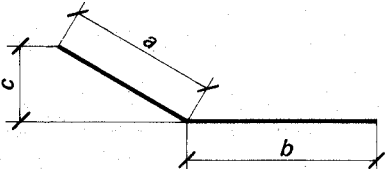

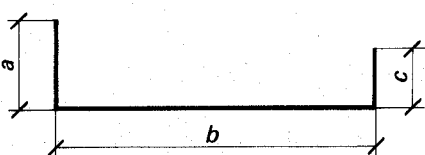

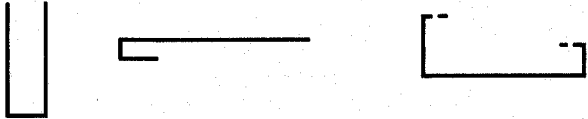

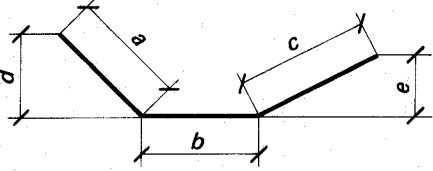

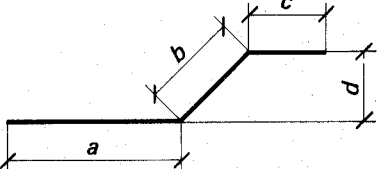

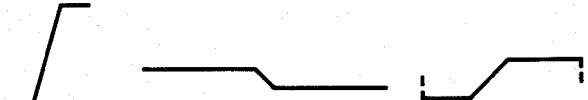

5 LIST OF PREFERRED SHAPES

When a third character is used, the direction of the end anchorages shall be as shown by the dotted lines in the examples in table 2.

It is recognized that in some countries hooks are used for end anchorages.

The letter symbols refer to the dimensions which shall be given in the bar schedule.

6 BAR SCHEDULE

The bar schedule is the document used to specify and identify reinforcing bars. The format specified below incorporates the use of preferred shapes.

6.1 Information content

A bar schedule shall contain the following information in the sequence listed below :

- a) member — identification of the structural member in which the bar is located;
- b) bar mark — unique reference of the bar;
- c) type of steel;
- d) diameter of bar;
- e) length of each bar [cutting length, allowing for loss or gain at bends, calculated from the dimensions and radii given in k); see clause 3];
- f) number of members;
- g) number of bars in each member;
- h) total number of bars f) × g);
- i) total length e) × h);
- j) shape code (as defined in clause 5);
- k) bending dimensions;
- l) revision letter;
- m) title block;

An example of a form of bar schedule is shown on page 7.

6.2 Special shapes

When special shapes are required, these shall be shown by a dimensioned sketch drawn in the space normally used for bending dimensions.

6.3 Title block

The title block shall be placed below the schedule, and shall contain the following information :

- a) name of the structural designer;
- b) title of the project;
- c) date prepared
prepared by . . .
checked by . . .
- d) drawing number;
- e) bar schedule reference;
- f) revision letter and date of last revision;
- g) a statement that the schedule has been prepared in accordance with the requirements of ISO 4066.

7 SUMMARY SHEET

If required, summary sheets may be used; separate sheets shall be used for each type of steel.
