Designation: ~~A355 – 89 (Reapproved 2012)~~ A355 – 89 (Reapproved 2017)

Standard Specification for Steel Bars, Alloys, for Nitriding[1]

This standard is issued under the fixed designation A355; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers alloy steel bars, suitable for surface hardening by nitriding, designated as Classes A, B, C, and D. Class A and Class D bars are general-purpose bars; Class B bars are free-machining bars; Class C bars contain 3.50 % nickel and are characterized by higher core strength. All classes are normally furnished in the hot-rolled, quenched, and tempered condition. However, centerless-ground or turned bars, in any of the classes, may be specified by the purchaser. Also, as-rolled, annealed, or unannealed bars suitable for forging may be purchased to this specification. When as-rolled, annealed, or unannealed bars are furnished, Sections 6, 10, and 11 are not applicable.

1.2 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.

1.3 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

A29/A29M Specification for General Requirements for Steel Bars, Carbon and Alloy, Hot-Wrought

3. Ordering Information

3.1 Orders under this specification should include the following as required to adequately describe the desired materials:

3.1.1 Quantity (weight or number of pieces),
3.1.2 Name of material (alloy steel bars, for nitriding),
3.1.3 Surface finish (Section 14),
3.1.4 Cross-sectional shape,
3.1.5 Size,
3.1.6 Length (Section 13),
3.1.7 Class (Section 1),
3.1.8 Thermal treatment (Section 6),
3.1.9 Hardness (Section 11),
3.1.10 Microstructure when desired (Section 7),
3.1.11 Report of ladle analysis if desired (Section 9),
3.1.12 Straightness (Section 10),
3.1.13 ASTM designation A355, and
3.1.14 End use, exceptions to the specification, or special requirements.

4. Process

4.1 The steel shall be made by the electric-furnace process only.

---

5. Discard

5.1 Sufficient discard shall be made from each ingot to ensure freedom from injurious piping and undue segregation.

6. Quenching and Tempering

6.1 The bars shall be given a liquid quench followed by a tempering treatment at a temperature not lower than ~~600°C (1112°F)~~600 °C (1112 °F) to produce a fine spheroidized structure.

7. Microstructure

7.1 When specified the microstructure resulting from the heat treatment specified in Section 6 shall not show free ferrite in amounts exceeding those prescribed in Table 1. Other percentages of free ferrite may be supplied by agreement between the manufacturer and the purchaser.

7.2 The amount of free ferrite shall be determined by metallographic examination under suitable magnification of a specimen from the bars in the quenched and tempered condition. The number and location of tests and details of the basis of establishing free ferrite shall be as agreed upon between the manufacturer and the purchaser.

8. Decarburization

8.1 The maximum depth of total and partial decarburization of hot-rolled bars and heat-treated bars shall not exceed the amounts prescribed in Table 2.

8.2 Centerless-ground or turned bars shall be free from total and partial decarburization.

9. Heat Analysis

9.1 The steel shall conform to the requirements as to cast or heat (formerly ladle) analysis prescribed in Table 3.

10. Straightness

10.1 Unless otherwise specified, all material shall be supplied to a maximum straightness tolerance of ⅛ in. (3.18 mm) in any 5 ft (1.5 m) but it may not exceed the following:

Maximum straightness deviation, in. = ⅛ × (length in ~~feet)/5~~feet)/5.

11. Hardness Test

11.1 The hardness of the steel after quenching and tempering shall conform to one of the ranges as specified in Table 4.

12. Permissible Variations in Dimensions

12.1 The hot-rolled bars shall not vary from the specified dimensions by more than the amounts prescribed in Specification A29/A29M.

12.2 The diameter of centerless ground bars shall not vary from that specified by more than the following:

Specified Diameter, in. (mm)	Permissible Variations, Over or Under, in. (mm)
~~Under ¼ (6.35)~~	~~0.0005 (0.013)~~
~~¼ to 11/32 (6.35 to 8.73), incl~~	~~0.001 (0.025)~~
~~Over 11/32 to 19/32 (8.73 to 15.08), incl~~	~~0.0015 (0.038)~~
~~Over 19/32 to 1 3/32 (15.08 to 27.78), incl~~	~~0.002 (0.051)~~
~~Over 1 3/32 (27.78)~~	~~0.0025 (0.064)~~

TABLE 1 Permissible Free Ferrite

Diameter or Thickness, in. (mm)	Permissible Free Ferrite Area, max, %
1.00 (25.4) and under	2
Over 1.00 to 3.00 (25.4 to 76.2), incl	4
Over 3.00 (76.2)	6
