Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://ipr.etsi.org>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Report (TR) has been produced by ETSI Technical Committee Environmental Engineering (EE).

Introduction

As greenhouse effect and carbon footprint are becoming more common and well known to normal citizen; a lot of attention has been also pointed to the telecommunication community impact. The growing public attention to environmental issues leads industry to work on reducing environmental impacts of their business, also in a framework of Corporate Social Responsibility (CSR) and sustainable development.

High prices for oil and electrical energy, which are expected to persist, contribute to stimulate interest in new energy sources.

In telecommunication alternative energy sources are generally used in remote areas where the public mains is unavailable.

The introduction of new components and technologies on the market increases the energy efficiency of alternative sources and in some cases Governments support (economically) the use of these alternative energy sources.

The consequence of those two facts is a better convenience in the use of this type of energy, especially considering the continuous price increase for traditional fossil sources and electrical energy, beyond the attention that is necessary for reducing ecological impacts.

The need for alternative energy may come also to enable telecommunication services (areas with no power grid), to expand coverage and to deploy high data rate services (active equipment in the access network).

It becomes obvious that the use of alternative energy has to be considered with particular effort for only supplying energy efficient ICT equipment.

One important bibliographical reference is the international document produced by ITU-T (CCITT), in 1985 [i.1].

1 Scope

Due to new power and energy context such as greenhouse effect and other environmental issues, fuel depletion and electricity cost increase, new regulation and standards, telecom operators have to make efforts to use alternatives. The present document covers alternative energy sources completed by current and new energy storage that can be used in ICT. Such alternative energy sources are:

- fuel cells;
- photovoltaic generators;
- wind turbine generators;
- micro hydro generators;
- stirling machine;
- alternative cooling sources, e.g. geo-cooling, fresh air cooling (or free cooling), absorption machines.

It proposes an overview of practical solutions for power and cooling systems using alternative energy sources. Interoperability of heterogeneous alternative energy sources is the key issue. Hybrid systems reliability and efficiency is also in the scope of the present document.

Bearing in mind the availability and the maintainability of the power plants for TLC, the present document considers:

- the principle of energy converters operating from alternative energy sources;
- the minimum set of information on energy converters;
- the main sizing parameters;
- the architecture of the power systems using the energy converters either only one type or as a combination of two or more such devices;
- existing and new energy storage;
- cooling solutions from alternative sources (geo-cooling).

New (not traditional) solutions for cooling will be proposed and expanded in a separate document.

2 References

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at <http://docbox.etsi.org/Reference>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication ETSI cannot guarantee their long term validity.
