Foreword	iv
Introduction	v
1 Scope	1
2 Normative references	1
3 Terms and definitions	2
4 Principle of flushing	2
5 Flushing lines in a hydraulic system	2
5.1 Initial factors to consider.....	2
5.2 System layout.....	3
5.3 Component cleanliness level.....	3
5.4 Anti-corrosion agents.....	3
6 Treatment of lines	3
6.1 Preparation of lines during fabrication.....	3
6.2 Surface treatment.....	4
6.3 Storage of lines and connectors.....	4
7 Installation of piping systems	4
8 Flushing requirements	4
8.1 Flushing document.....	4
8.2 Flushing criteria.....	4
8.3 Flushing parameters.....	5
8.4 Filters and separation of particles.....	6
8.4.1 General requirements.....	6
8.4.2 Additional external flushing filters.....	6
8.5 Monitoring the progress of flushing.....	6
8.5.1 Options for monitoring.....	6
8.5.2 Sampling procedures.....	7
8.5.3 Minimum flushing time before oil samples are taken.....	7
8.6 Flushing procedures.....	7
8.6.1 General.....	7
8.6.2 Preliminary stages.....	7
8.6.3 Stage 1 — Flushing at low pressure.....	8
8.6.4 Stage 2 — Flushing at higher pressures.....	8
8.6.5 Verification of final cleanliness level.....	8
9 Identification statement (reference to this document)	8
Annex A (informative) Guidelines for obtaining the Required Cleanliness Level (RCL) for a system	9
Annex B (informative) Factors influencing the effectiveness and duration of flushing	11
Annex C (informative) Identification and relationship between the main flushing requirements	13
Bibliography	18

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 131, *Fluid power systems*, Subcommittee SC 6, *Contamination control*.

This second edition cancels and replaces the first edition (ISO 23309:2007) which has been technically revised.

The main changes compared to the previous edition are as follows:

- identifies the shortfall of the Reynolds formula when it's used in isolation;
- identifies the importance of flushing oil velocity, temperature, and viscosity;
- identifies to the practitioners who perform flushing procedures that if they only consider the *Re* value the flushing velocity could be much less than the system oil flow within the system and what it will be subjected to in normal service;
- raises awareness and importance of the factors other than the *Re* value that affect the effectiveness, efficiency and reliability of any flushing process.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.
