11.4.7	Ocean meteorological data.....	51
11.5	Study outcomes.....	51
11.5.1	Discrete system-filtered sound pressure versus time.....	51
11.5.2	Decidecade sound pressure level.....	52
11.5.3	Sound pressure basic statistics.....	52
11.5.4	Millidecade or 1-Hz ('Narrowband') sound pressure level.....	52
11.5.5	Narrowband sound pressure spectral density level.....	52
11.5.6	Sound pressure level distribution	53
11.5.7	Sound pressure spectral probability density	53
11.6	Dataset stewardship.....	54
	Annex A (informative) Examples of deployment.....	56
	Annex B (informative) Discrete Fourier transform and associated terms	61
	Annex C (informative) Guidance on measuring system performance	66
	Annex D (informative) List of applications and suggested frequency ranges	70
	Annex E (informative) QA check on data quality.....	71
	Bibliography.....	72

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 43, *Acoustics*, Subcommittee SC 3, *Underwater acoustics*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

This document describes a procedure for the measurement and analysis of underwater ambient sound. The development of this document made use of resources previously developed by the UK National Physical Laboratory^[20], the US-funded project ADEON¹⁾ and by the EU-funded Interreg programme JOMOPANS²⁾.

Underwater acoustics — Measurement of underwater ambient sound

1 Scope

This document provides requirements and recommendations for measuring and reporting ambient sound in water, as characterized by sound pressure and selected quantities that can be derived from sound pressure. “Ambient sound” implies sound from any source except sources of self-noise.

The scope includes equipment performance, calibration and deployment, digital data acquisition and data processing. Data processing is the process of converting raw data into a form and context necessary to be interpreted by people and computers. The scope includes data analysis and reporting of recordings of duration one day or longer.

Five data processing stages are considered: raw digital acquisition data³⁾, sound pressure time series, sound pressure level time series, sound pressure spectra and their statistics.

The scope excludes measurement of particle motion.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document, the terms and definitions given in BIPM 2019, ISO 80000-1, ISO 80000-2, ISO 80000-3, ISO 80000-8, IEC 80000-13, ISO 18405 and the following apply.

3) The word data is generally used as a collective noun in this document; the plural form is reserved for cases where the constructive relationship to individual observations or measurements is to be emphasized.
