Foreword ..... **v**
Introduction ..... **vi**
1 Scope **1**
2 Normative references **1**
3 Terms and definitions **1**
4 Ignition processes **3**
5 Characteristics of ignition sources **4**
6 General principles **4**
6.1 Flaming ignition sources 4
6.1.1 Diffusion flame ignition source 4
6.1.2 Premixed flame source 4
6.2 Issues associated with flaming ignition sources 4
6.3 Non-flaming ignition sources 5
7 Smouldering (cigarette) ignition sources **6**
7.1 Traditional cigarettes 6
7.2 Non-reduced ignition propensity cigarettes 7
8 Non-flaming electrical ignition sources **7**
8.1 Glow-wire ignition 7
8.2 Hot-wire ignition 9
9 Radiant ignition sources **10**
9.1 Conical radiant ignition sources 10
9.1.1 General 10
9.1.2 Cone calorimeter ignition source 10
9.1.3 Smoke chamber conical heater 13
9.1.4 Periodic flaming ignition test 16
9.2 Other radiant ignition sources 17
9.2.1 Glowbars ignition source 17
9.2.2 Lateral ignition and flame spread test (LIFT) radiant panel heater. 18
9.2.3 Setchkin ignition 18
10 Infrared heating system **21**
11 Diffusion flame ignition **21**
11.1 Needle flame ignition 21
11.2 Burning match 22
11.3 Burners generating 50 W or 500 W flames 24
12 Premixed burners **27**
12.1 Premixed burner for 1 kW flame 27
12.2 Burners for vertical cable tray tests 28
12.2.1 Venturi burners for 20 kW vertical cable tray tests 28
12.2.2 Burner for vertical riser cable tests 30
12.3 Burner for large scale horizontal tests 30
12.4 Burners for room corner tests 31
12.4.1 Burner for ISO 9705-1 31
12.4.2 Alternate burner for room corner test 32
12.5 Burners for individual product heat release tests 33
12.5.1 Burner for single fuel package calorimeter 33
12.5.2 Square tube propane burner 33
12.5.3 T-shaped propane burner 34
12.5.4 Dual T-shaped propane burner 34
13 Other ignition sources **35**

13.1 Wood cribs 35
13.2 Paper bags 35
Bibliography **37**

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

The committee responsible for this document is Technical Committee ISO/TC 61, *Plastics*, Subcommittee SC 4, *Burning behaviour*.

This first edition of ISO/TR 10093 cancels and replaces ISO 10093:1998, which has been technically revised.

The main changes compared to the previous edition are as follows:

— the document has been updated and converted from an International Standard to a Technical Report;

— several additional ignition sources have been added, including some that originate in standards that have not been issued by ISO or IEC;

— no details of wood crib and paper bag ignition sources are included;

— Annex A and Annex B have been deleted;

— the information that used to be in Annex A on confirmatory procedure for evaluating test flames is described in IEC 60695-11 and in ASTM D5207;

— the bibliography formerly contained in Annex B has been extended.

Introduction

Fires are caused by a wide range of possible ignition sources. Statistical analysis of fires has identified the main primary and secondary sources, especially for fires in buildings. The most frequent sources of fires have been found to be as follows:

a) cooking appliances;

b) space-heating appliances;

c) electric wiring, connectors and terminations;

d) other electrical appliances (such as washing machines, bedwarmers, televisions, water heaters);

e) cigarettes;

f) matches and smokers' gas lighters;

g) blow-lamps, blow-torches and welding torches;

h) rubbish burning; and

i) candles.

The above list covers the major primary ignition sources for accidental fires. Other sources can be involved in fires raised maliciously. Research into causes of fires has shown that primary ignition sources (e.g. glowing cigarettes or dropped flaming matches) can set fire to waste paper, which then acts as a secondary ignition source of greater intensity.

When analysing and evaluating the various ignition sources for applications involving plastics materials, it is important to answer the following questions on the basis of detailed fire statistics.

1) What is the significance of the individual ignition sources in various fire risk situations?

2) What proportion is attributable to secondary ignition sources?

3) Where does particular attention have to be paid to secondary ignition sources?

4) To what extent are different ignition sources responsible for fatal fire accidents?

The following laboratory ignition sources are intended to simulate actual ignition sources that have been shown to be the cause of real fires involving plastics. Laboratory ignition sources are preferred over actual ignition sources due to their consistency, which results in greater data repeatability within a laboratory and greater reproducibility between laboratories.

These laboratory ignition sources can be used to develop new test procedures.
