Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2. www.iso.org/directives

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received. www.iso.org/patents

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see the following URL: <http://www.iso.org/iso/foreword.html>

The committee responsible for this document is Technical Committee ISO/TC 268, *Sustainable development in communities*, Subcommittee SC 1, *Smart community infrastructures*.

Introduction

In the foreseeable future, urban density is likely to increase, resulting in further urbanization complexity. From this perspective, a “smart community” approach is an important concept to address such urban challenges by integrating different forms of infrastructures in a rational and efficient manner.

An important aspect of a smart community is integrating infrastructures as “a system of systems”. Until now it has not been possible to ensure consistency across infrastructure types to meet the requirements for smart community infrastructures as owners have focused on just assembling solutions to each subsystem of infrastructures.

In order to ensure consistency of smart community infrastructures as a whole, first, functions of each subsystem need to be clarified and arranged based on the needs for a smart community, and secondly, the perspectives of various stakeholders and lifecycle of infrastructures need to be considered.

Thus, a new framework is needed to develop a procedure followed by all stakeholders in order to establish an orchestration function of each smart community infrastructure component and to achieve information sharing as well as consensus amongst the stakeholders.

For this purpose, ISO/TC 268/SC 1/AHG 1 “Common framework for development and operation of smart community infrastructures” was established to conduct preliminary studies to develop international standards to formulate a framework which realizes well-functioning smart community infrastructures as a whole, considering their characteristics, i.e. “a system of systems”, having various stakeholders, and long lifecycle. These standards will formulate technical procedures for stakeholders to achieve their accountability in developing, operating and maintaining smart community infrastructures as a system of systems. This document presents the results of the study conducted in the AHG. The framework aims to ensure consistency between smart community infrastructures without overlapping with existing work (see [Figure 1](#)). It incorporates the metrics as a KPI of the development, operation and maintenance methodology.

This framework is concerned to ensure the consistency of different systems consisting smart community infrastructures so that they function rationally as a whole.

Smart community infrastructures — Common framework for development and operation

1 Scope

This document outlines the basic concept of a common framework for the development and operation of smart community infrastructures. The framework describes the planning, development, operation and maintenance methodology to facilitate the harmonization of each infrastructure as a part of a smart community and ensures that the interactions between multiple infrastructures are well orchestrated.

The framework is applicable to all processes of smart community infrastructures' life cycle (from conceptual design through planning, development, operation, maintenance, redevelopment and feedback). The infrastructures to be covered are energy, water, transportation, waste management, ICT and others.

The framework can be adopted by all relevant stakeholders who are engaged in planning, development and operation of smart community infrastructures, including planners, developers, business operators and suppliers. The framework is intended to cover the processes in which these stakeholders are engaged, such as management, organizational structure, analyses and design methods, and documentations.

2 Possible issues and solutions in developing and operating smart community infrastructures

2.1 Possible issues and solutions

Features of smart community infrastructure can be described as below:

- Smart community infrastructure is infrastructure that has a high level of financial and resource efficiency and convenience for people.
- To achieve the above state, smart community infrastructure
 - has orchestration function to achieve synergy effect of multiple types of infrastructures to improve financial and resource efficiency and convenience for people, and
 - maintains its efficiency in adaptive manners against any changes of city's circumstances including disasters and demographic changes to improve financial and resource efficiency and convenience for people (resiliency / dependability).

NOTE 1 Efficiency means output performance divided by resource input.

NOTE 2 The orchestration function can be implemented by either a centralized approach or a decentralized autonomous approach.

Since smart community infrastructures have the features shown above, they may have three characteristics different from those of conventional infrastructures (see [Figure 2](#)). Issues are identified from the characteristics as below. In addition, solutions corresponding to these issues are extracted as elements of the framework.

- Issues due to “a system of systems” and long life cycle:
 - Difficulties in ensuring consistency among components, without which functionality of the whole system of smart community infrastructures cannot occur.
