DRAFT
prEN 18329

April 2026

ICS 13.020.40

English Version

Measurement of CO₂ streams - Sampling and analysis for pipeline transportation

Mesurage des flux de CO₂ - Échantillonnage et analyse pour les systèmes de transport par conduites

Quantifizierung und Verifizierung von Kohlenstoffdioxid in der gesamten CCS-Wertschöpfungskette

This draft European Standard is submitted to CEN members for enquiry. It has been drawn up by the Technical Committee CEN/TC 474.

If this draft becomes a European Standard, CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CEN in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

prEN 18329:2026 (E)**European foreword**

This document (prEN 18329:2026) has been prepared by Technical Committee CEN/TC 474 “Carbon dioxide Capture, transportation, Utilisation, and Storage (CCUS)”, the secretariat of which is held by NEN.

This document is currently submitted to the CEN Enquiry.

Sample Document

get full document from standards.iteh.ai

Introduction

The document provides requirements and recommendations for the selection, operation, and quality assurance of sampling and analysis measurement equipment.

The information presented in this document is based on the best available knowledge at the time of writing, incorporating both experimental and operational experience where possible. In areas where such experience is not yet available, a conservative approach has been adopted, following common practices established across similar industries. As further experience is gained, it is expected that this document will be revised accordingly.

prEN 18329:2026 (E)**1 Scope**

This document specifies requirements and recommendations for measuring the composition of CO₂ streams during post capture pipeline transportation.

The primary objective of this document is to establish standardized technical requirements and recommendations necessary for implementing regulations, commercial contracts, inventory ownership and fiscal transactions within the framework of Carbon Capture and Storage (CCS).

This document includes measurements up to the storage injection points but does not cover Measurement, Monitoring, and Verification (MMV) once the CO₂ has entered the geological storage complex.

The differentiation between biogenic and non-biogenic CO₂ in a CO₂ stream is recognized as highly relevant for accounting purposes. However, the measurement methodologies for the biogenic CO₂ fraction fall outside the scope of this document, which covers post-capture pipeline transportation. This document is not intended to differentiate between biogenic CO₂ and CO₂ produced from non-biogenic sources.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO/IEC Guide 98-3:2008, *Uncertainty of measurement — Part 3: Guide to the expression of uncertainty in measurement (GUM:1995)*

ISO 14167:2018, *Gas analysis — General quality aspects and metrological traceability of calibration gas mixtures*

3 Terms, definitions and abbreviations**3.1 Terms and definitions**

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- IEC Electropedia: available at <https://www.electropedia.org/>
- ISO Online browsing platform: available at <https://www.iso.org/obp/>

3.1.1**adjustment of a measuring instrument**

operation of bringing a measuring instrument into a state of performance suitable for its use

Note 1 to entry: Adjustment can be automatic, semi-automatic, or manual.

[SOURCE: EN ISO 14532:2017]

3.1.2**analysis of CO₂ stream**

measurement methods and techniques for determining the *composition of a CO₂ stream* (3.1.14)

[SOURCE: EN ISO 14532:2017, 2.5.2.1.4, modified — “CO₂ stream” replaces “gas”.]

3.1.3**analytical unit**

analyser

assembly which enables qualitative and/or quantitative determinations (measurements) of substances on the basis of their chemical or physical properties

Note 1 to entry: A typical assembly can comprise:

- connectors/manifold permitting the introduction and removal of a sample and/or calibration gas(es),
- a measuring cell which, from the physical or chemical properties of the components present in the sample, gives signals allowing their identification or measurement, and
- signal processing devices (e.g. amplifiers, integrators, recorders) and/or data processing devices.

Note 2 to entry: Assembly does not comprise the *sampling system*.

[SOURCE: ISO 7504:2015, 8.3.1, modified — “connectors/manifold” replaces “lines” in Note 1 to entry; Note 2 to entry added.]

3.1.4**analytical unit cycle time**

analyser cycle time

time required for the analytical unit to process and analyse the sample after it has reached the unit and to generate a measurement output signal

Note 1 to entry: This includes the time taken for processing the analytical unit *response* (3.1.48) and/or the data analysis within the analytical unit, but does not account for the time required for the transmission of the measurement output signal outside the analytical unit.

3.1.5**analysis function**

relationship describing component content as a function of instrument response

Note 1 to entry: It refers to the analysis function of the analytical unit for composition determination.

[SOURCE: EN ISO 10723:2012, 3.8, modified — Note 1 to entry added.]

3.1.6**blank material**

material which contains no, or as little as possible, of the analyte of interest used in measurement to establish a blank indication

[SOURCE: 'blank material' in IUPAC Compendium of Chemical Terminology, 5th ed. International Union of Pure and Applied Chemistry; 2025. Online version 5.0.0, 2025. <https://doi.org/10.1351/goldbook.08010>]

3.1.7**bubble point pressure**

pressure of the saturated liquid at a given composition and temperature

[SOURCE: EN ISO 27913:2025, 3.3]

prEN 18329:2026 (E)**3.1.8****calibration**

operation that, under specified conditions, in a first step establishes a relation between the quantity values with measurement uncertainties provided by measurement standards and corresponding indications with associated measurement uncertainties and, in a second step uses this information to establish a relation for obtaining a measurement result from an indication

Note 1 to entry: A calibration can be expressed by a statement, calibration function, calibration diagram, calibration curve, or calibration table. In some cases, it consists of an additive or multiplicative correction of the indication with associated measurement uncertainty.

Note 2 to entry: Calibration should not be confused with adjustment of a measuring system, often mistakenly called “self-calibration”, nor with verification of calibration.

Note 3 to entry: Often, the first step alone in the above definition is perceived as being calibration.

[SOURCE: EN ISO 14532:2017, 2.5.1.1]

3.1.9**calibration gas mixture**

CGM

gas mixture whose composition is sufficiently well established and stable to be used as a *working measurement standard* (3.1.73) of composition

[SOURCE: EN ISO 10723:2012, 3.4, modified — Note 1 to entry deleted.]

3.1.10**calibration function**

relationship describing instrument response as a function of component content established by calibration

Note 1 to entry: It refers to the calibration function of the analytical unit for composition determination.

[SOURCE: EN ISO 10723:2012, 3.7, modified — Note 1 to entry added; “established by calibration” added.]

3.1.11**carbon dioxide stream**

CO₂ stream

stream consisting overwhelmingly of carbon dioxide (usually > 95 mol% CO₂)

3.1.12**certified reference gas mixture**

CRM

reference gas mixture, characterized by a metrologically valid procedure for one or more specified properties, accompanied by a certificate that provides the value of the specified property, its associated uncertainty, and a statement of metrological traceability

Note 1 to entry: The above definition is based on the definition of “certified reference material” in ISO Guide 35:2017. “Certified reference material” is a generic term; “certified reference gas mixture” is more suited to this application.

Note 2 to entry: Metrologically valid procedures for the production and certification of reference materials (such as certified reference gas mixtures) are given in, among others, ISO Guide 34:2009 and ISO Guide 35:2017.

Note 3 to entry: ISO Guide 31:2015 gives guidance on the contents of certificates.

[SOURCE: EN ISO 10723:2012, 3.2]

3.1.13**component**

chemical entity at a defined physical state present in a material or in a mixture

[SOURCE: ISO 7504:2015, 3.3]

3.1.14**composition of CO₂ stream**

identity and *content* (3.1.16) of each of the *components* (3.1.13) that constitute a particular CO₂ stream

3.1.15**consequence**

outcome of an event affecting objectives

Note 1 to entry: A consequence can be certain or uncertain and can have positive or negative direct or indirect effects on objectives.

Note 2 to entry: Consequences can be expressed qualitatively or quantitatively.

Note 3 to entry: Any consequence can escalate through cascading and cumulative effects.

[SOURCE: ISO 31000:2018, 3.6]

3.1.16**content**

mass fraction, volume fraction, mole fraction (3.1.37), *mass concentration, molar concentration, volume concentration* (3.1.38) of a *component* (3.1.13) in a CO₂ stream

Note 1 to entry: See EN ISO 14912:2025 for further information about this concept.

3.1.17**continuous sampling**

direct sampling (3.1.21) taken continuously from a CO₂ stream with a constant flow rate in a certain period of time

[SOURCE: ISO 19230:2020, 3.17, modified — “CO₂ stream” replaces “a stream of material”.]

3.1.18**critical point**

highest temperature and pressure at which a pure substance (e.g. CO₂) can exist as a gas and a liquid in equilibrium

Note 1 to entry: For a multicomponent fluid mixture of a given composition, the critical point is the merge of the bubble point curve and the dew point curve.

Note 2 to entry: The critical point can be established with the *critical pressure* and the *critical temperature*.

[SOURCE: EN ISO 27913:2025, 3.6]

3.1.19**critical pressure**

vapour pressure at the *critical temperature* (3.1.20)

Note 1 to entry: The critical pressure for pure CO₂ is 7,38 MPa.

[SOURCE: EN ISO 27913:2025, 3.7]

prEN 18329:2026 (E)**3.1.20****critical temperature**

pure substance temperature above which liquid cannot be formed simply by increasing the pressure

Note 1 to entry: The critical temperature of pure CO₂ is 304,13 K (equivalent to 30,98 °C).

Note 2 to entry: For *CO₂ streams* (3.1.11), phase transitions can still occur above critical temperature.

[SOURCE: EN ISO 27913:2025, 3.8]

3.1.21**direct sampling**

sampling (3.1.53) in situations where there is a direct connection between the CO₂ stream to be sampled and the analytical unit

[SOURCE: EN ISO 10715:2022, 3.5, modified — “the CO₂ stream” replaces “the natural gas”.]

3.1.22**dense phase**

CO₂ streams in the single-phase fluid state above a density of 500 kg/m³

Note 1 to entry: Dense phase is an engineering term and not a thermodynamic phase (i.e. liquid, gas, solid, and supercritical).

[SOURCE: EN ISO 27913:2025, 3.9, modified — “understood to be CO₂ streams” replaces “understood to be CO₂ or CO₂ streams”; Note 1 to entry added.]

3.1.23**dew point pressure**

pressure on the saturated vapour line

[SOURCE: EN ISO 27913:2025, 3.10]

3.1.24**extended working range**

range of parameters for which the correlation has been developed, but outside the range for which the calibration function has been validated

[SOURCE: EN ISO 14532:2017, 2.5.1.8]

3.1.25**floating piston cylinder**

sample container (3.1.52) that has a moving piston separating the sample from a precharge gas

Note 1 to entry: The pressures are in balance on both sides of the piston.

[SOURCE: ISO 19230:2020, 3.4]

3.1.26**flow assurance**

engineering discipline that is required to understand the behaviour of fluids inside pipelines, at flowing and static conditions

[SOURCE: EN ISO 27913:2025, 3.13]

3.1.27**in-line measurement**

composition measurement where the CO₂ stream is analysed directly within the pipeline, without *sampling* (3.1.53)

3.1.28**incremental sampler**

sampler which accumulates a series of *spot samples* (3.1.66) into one composite sample

[SOURCE: EN ISO 10715:2022, 3.11, modified — “the CO₂ stream” replaces “the natural gas”.]

3.1.29**incremental sampling**

indirect sampling (3.1.30) by accumulating a series of *spot samples* (3.1.66) into one composite sample

3.1.30**indirect sampling**

sampling (3.1.53) in situations where there is no direct connection between the the CO₂ stream to be sampled and the analytical unit

[SOURCE: EN ISO 10715:2022, 3.11, modified — “the CO₂ stream” replaces “the natural gas”.]

3.1.31**intermittent sampling**

direct sampling (3.1.21) from a CO₂ stream with predetermined intervals

[SOURCE: EN ISO 10715:2022, 3.11, modified — “a CO₂ stream” replaces “a stream of material”.]

3.1.32**lag time**

time taken for a *representative sample* (3.1.46) to enter the analytical unit from the *sample point*

[SOURCE: ISO 19230:2020, 3.24, modified — “analytical unit” replaces “instrument”; “from the *sampling point*” added.]

3.1.33**likelihood**

chance of something happening

Note 1 to entry: In *risk management* (3.1.51) terminology, the word “likelihood” is used to refer to the chance of something happening, whether defined, measured or determined objectively or subjectively, qualitatively or quantitatively, and described using general terms or mathematically (such as a probability or a frequency over a given time period).

Note 2 to entry: The English term “likelihood” does not have a direct equivalent in some languages; instead, the equivalent of the term “probability” is often used. However, in English, “probability” is often narrowly interpreted as a mathematical term. Therefore, in risk management terminology, “likelihood” is used with the intent that it should have the same broad interpretation as the term “probability” has in many languages other than English.

[SOURCE: ISO 31000:2018, 3.7]

prEN 18329:2026 (E)**3.1.34****Limit of Detection**

LOD

detection limit

derived from the smallest measure, that can be detected with reasonable certainty for a given analytical procedure

Note 1 to entry: The value is given by the equation:

$$LOD = \bar{y}_b + k \sigma_b$$

where

\bar{y}_b is the mean of the blank measures,

σ_b is the standard deviation of the blank measures, and

k is a numerical factor chosen according to the confidence level desired.

[SOURCE: 'limit of detection' in IUPAC Compendium of Chemical Terminology, 5th ed. International Union of Pure and Applied Chemistry; 2025. Online version 5.0.0, 2025. <https://doi.org/10.1351/goldbook.L03540>]

3.1.35**Limit of Quantification**

LOQ

smallest or largest measured quantity value, obtained by a given measurement procedure, which fulfils a requirement of fitness for purpose

Note 1 to entry: The quantity measured is usually a mass fraction or a concentration but can also be for example, a mass or an amount of substance.

Note 2 to entry: The requirement can, for example, be a standard deviation under repeatability conditions of measurement or a measurement uncertainty.

Note 3 to entry: The smallest and largest measured quantity values correspond to the *Lower Limit of Quantification (LLOQ)* and the *Upper Limit of Quantification (ULOQ)*, respectively. The interval between the LLOQ and ULOQ is the *working interval* (3.1.74).

Note 4 to entry: If the LLOQ is estimated as a multiple of the standard deviation of measured values of a *blank material* (3.1.6) (or one spiked with a small aliquot of the component) obtained under repeatability conditions of measurement, it is important to document the multiplication factor, which may be 5, 6, or 10, applied so that different values stated for the LLOQ can be compared.

[SOURCE: IUPAC Compendium of Chemical Terminology, 5th ed. International Union of Pure and Applied Chemistry; 2025. Online version 5.0.0, 2025. <https://doi.org/10.1351/goldbook.08022>]

3.1.36**Lower Limit of Quantification**

LLOQ

smallest measured quantity value, obtained by a given measurement procedure, which fulfils a requirement of fitness for purpose

3.1.37**mass (volume)**

(mole) fraction

quotient of the mass [volume (under specified conditions of pressure and temperature)] (amount of substance) of a *component A* to the sum of the masses [sum of the volumes (intended prior to mixing under specified conditions of pressure and temperature)] (sum of the amounts of substances) of all components of the CO₂ stream

Note 1 to entry: Mole fraction and amount-of-substance fraction are interchangeable terms.

[SOURCE: EN ISO 14532:2017, 2.5.2.1.1, modified — “CO₂ stream” replaces “gas mixture”; Note 1 to entry added.]

3.1.38**mass (molar)**

(volume) concentration

quotient of the mass [volume (under specified conditions of pressure and temperature)] (amount of substance) of each *component* (3.1.13) to the volume of the CO₂ stream under specified conditions of pressure and temperature

Note 1 to entry: The mass, molar, and volume concentrations depend on the pressure and temperature of the CO₂ stream.

Note 2 to entry: Molar concentration and amount-of-substance concentration are interchangeable terms.

[SOURCE: EN ISO 14532:2017, 2.5.2.1.2, modified — “CO₂ stream” replaces “gas mixture”; Note 2 to entry added.]

3.1.39**measurement system response time**

measuring system response time

overall time it takes for the composition *measuring system* (3.1.40) to measure the concentration of a specified component

Note 1 to entry: It consists of the *lag time* (3.1.32) and the *analytical unit cycle time* (3.1.4).

3.1.40**measuring system**

set of one or more measuring instruments and often other devices, including any reagent and supply, assembled and adapted to give information used to generate measured quantity values within specified intervals for quantities of specified kinds

Note 1 to entry: Composition measuring system include the *analytical unit* (3.1.3) and the *sampling system* (3.1.63).

[SOURCE: JCGM 200:2012, modified — Note 1 to entry added.]

3.1.41**minimum design temperature**

lowest possible temperature to which the equipment or system may reasonably be exposed locally during installation and operation

[SOURCE: EN ISO 27913:2025, 3.19]
