Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 197, *Hydrogen technologies*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 268, *Cryogenic vessels and specific hydrogen technologies applications*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This first edition is a companion document to ISO 17268-1:2025, but for high flow (HF) systems.

The main changes compared to ISO 17268-1:2025 are as follows:

- Requirements and test procedures for connectors at flow rates greater than 120 g/s
 - [Section 4.11 Table 4](#) volume values increased to 30 cm³
 - [Section 4.12 Table 5](#) flow rate values increased to represent higher flow rates
 - [Section 5.15](#) connection force value increased to 150 N
 - [Section 5.16](#) disconnection force value increased to 450 N
 - [Section 7.6](#) height value decreased to 1,8 m
 - [Section 7.9](#) changed vibration test profile to match commercial vehicle applications
 - [Section 7.20](#) eliminated submersion depth to account for larger components
 - [Section 7.22](#) added increased shim diameters
 - [Section 7.24](#) suspended weight value increased to 10 kg
 - [Section 7.25.1](#) cycles decreased to 6 with 10 min pulses, 15 min pauses
 - [Section 7.26](#) applied moment was increased to 115 Nm
 - [Annex A](#) clearance envelope increased to accommodate larger nozzles
 - [Annexes B-E](#) drawings added for high flow receptacle profiles

ISO/DIS 17268-2:2026(en)

- [Annex G](#) drawings added for larger couplings

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Gaseous hydrogen land vehicle refuelling connection devices —

Part 2: Flow capacities greater than 120 g/s

1 Scope

This document defines the design, safety and operation characteristics of gaseous hydrogen land vehicle (GHLV) refuelling connectors.

GHLV refuelling connectors consist of the following components, as applicable:

- receptacle and protective cap (mounted on vehicle);
- nozzle;
- communication hardware.

This document is applicable to refuelling connectors which have nominal working pressures or hydrogen service levels up to 70 MPa and having flow capacities greater than 120 g/s.

This document is not applicable to refuelling connectors dispensing blends of hydrogen with natural gas.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 188, *Rubber, vulcanized or thermoplastic — Accelerated ageing and heat resistance tests*

ISO 1431-1, *Rubber, vulcanized or thermoplastic — Resistance to ozone cracking — Part 1: Static and dynamic strain testing*

ISO 9227, *Corrosion tests in artificial atmospheres — Salt spray tests*

ISO 12103-1, *Road vehicles — Test contaminants for filter evaluation — Part 1: Arizona test dust*

ISO 16750-3, *Road vehicles — Environmental conditions and testing for electrical and electronic equipment — Part 3: Mechanical loads*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

ISO/DIS 17268-2:2026(en)

3.1 communication hardware

components which are used to transmit signals from the vehicle (*receptacle*) (3.18) to the dispenser (*nozzle*) (3.13), designed to meet SAE J2799 in case of infrared technology or an equivalent standard

Note 1 to entry: Other communication hardware technologies are under development, e.g. wireless technologies. At the time of publication, the standard ISO 19885-2 “Gaseous hydrogen — Fuelling protocols for hydrogen-fuelled vehicles — Part 2: Definition of communications between the vehicle and dispenser control systems” was being developed.

3.2 component pressure rating

maximum pressure at which it is permissible to operate a component as specified by the manufacturer at a specified temperature

Note 1 to entry: See [Table 1](#) for required component pressure ratings for various *pressure classes* (3.15) of fuelling connectors (3.3).

Note 2 to entry: Further guidance on dispenser pressure terminology is included in ISO 19880-1.

Table 1 — Dispensing system pressure levels and refuelling connector ratings

<i>NWP</i> (3.12) of vehicle (<i>receptacle</i>) (3.18) or <i>HSL</i> (3.8) of dispenser (<i>nozzle</i>) (3.13)	<i>Pressure class</i> (3.15)	<i>Maximum operating pressure (MOP)</i> (3.11)	<i>Dispensing system maximum allowable working pressure (MAWP)</i> (3.10) <i>Minimum dispenser component pressure rating</i>
<i>Equal to NWP of the vehicle storage system per vehicle label</i>		$1,25 \times HSL / 1,25 \times NWP$ <i>Highest fill pressure during normal fuelling</i>	$1,375 \times HSL$ <i>Highest permissible setpoint for dispenser pressure protection in ISO 19880-1:2020, 8.2.2.3</i>
35 MPa	H35HF ^a	43,75 MPa	48,125 MPa
70 MPa	H70HF ^a	87,5 MPa	96,25 MPa

^a This signifies the pressure class combined with the flow capacity.

3.3 connector

joined assembly of *nozzle* (3.13) and *receptacle* (3.18) which permits the transfer of hydrogen

3.4 cycle

process of making a positive connection between the *nozzle* (3.13) and the *receptacle* (3.18), pressurizing to the specified test pressure, depressurizing and disconnecting, unless otherwise specified in the test clause

3.5 dry air

air with a dew point adequate to prevent condensation during testing

3.6 dry helium

helium with a dew point adequate to prevent condensation during testing and at least 99 % pure

3.7 dry hydrogen

hydrogen which meets or exceeds the quality level in ISO 14687 Grade D or Grade F

ISO/DIS 17268-2:2026(en)

3.8 hydrogen service level HSL

pressure level used to characterize the hydrogen service of the dispenser based on the *NWP* (3.10) rating of the vehicle

Note 1 to entry: The numerical value of HSL also matches the number after the “H” in the pressure class (3.13).

Note 2 to entry: HSL is expressed in MPa.

3.9 leak test gas

gas for testing leaks that consists of *dry hydrogen* (3.7), or *dry helium* (3.6), or blends of a minimum 50 mmol/mol of hydrogen or helium with nitrogen

3.10 maximum allowable working pressure MAWP

maximum pressure permissible in a system at the temperature specified for the pressure

Note 1 to entry: The maximum allowable working pressure can also be defined as the PS, design pressure, the maximum allowable operating pressure, the maximum permissible working pressure, or the maximum allowable pressure for the rating of pressure vessels and equipment manufactured in accordance with national pressure vessel codes.

3.11 maximum operating pressure MOP

highest pressure that is expected for a component or system during normal operation

Note 1 to entry: Further guidance on dispenser pressure terminology is included in ISO 19880-1.

Note 2 to entry: The maximum operating pressure is 125 % of the *nominal working pressure* (3.12) or *hydrogen service level* (3.8), as applicable, for the purpose of testing of *nozzles* (3.13) and *receptacles* (3.18) in this document.

3.12 nominal working pressure NWP

pressure of a full vehicle compressed hydrogen storage system at a gas temperature of 15 °C

Note 1 to entry: See ECE/TRANS/180/Add.13/Amend.1 Part II-3.37.

Note 2 to entry: See [Table 1](#) for NWPs covered in this document.

Note 3 to entry: Further guidance on pressure terminology is included in ISO 19880-1.

Note 4 to entry: NWP is also known as “settled pressure” in ISO 10286.

3.13 nozzle

device connected to a fuel dispensing system, which permits the quick connect and disconnect of fuel supply to the vehicle or storage system

3.14 positive locking device

device with the feature which requires actuation of an interlocking mechanism to achieve proper connection of the *nozzle* (3.13) to the *receptacle* (3.18) before pressure is applied

ISO/DIS 17268-2:2026(en)

3.15

pressure class

non-dimensional rating of components that indicates the components are designed to dispense hydrogen to road vehicles at the required pressure and temperature

Note 1 to entry: See [Table 1](#) for pressure classes of fuelling *connectors* ([3.3](#)).

Note 2 to entry: Further guidance on dispenser pressure terminology is included in ISO 19880-1.

3.16

pressure drop

difference in pressure between two specific points at specific flow conditions

3.17

protective cap

means to prevent dirt and other contaminants from getting into the inlet of the vehicle *receptacle* ([3.18](#))

3.18

receptacle

device connected to a vehicle or storage system which receives the *nozzle* ([3.13](#))

Note 1 to entry: This can also be referred to as a fuelling inlet or gas filling port in other documents.

4 General construction requirements

4.1 Nozzles and receptacles shall be designed in accordance with reasonable concepts of safety, durability and maintainability.

4.2 Nozzles and receptacles designed and tested in accordance with this document shall

- a) prevent hydrogen fuelled vehicles from being filled by fuelling stations with pressures different than the design values specified for the vehicle, as shown in [Table 2](#);
- b) prevent hydrogen fuelled vehicles from being filled by fuelling stations with flow rates higher than the design values specified for the vehicle, as shown in [Table 3](#);
- c) prevent hydrogen fuel cell vehicles which can only use ISO 14687 Grade D hydrogen from being filled by fuelling stations that dispense ISO 14687 Grade F hydrogen, as shown in [Table 2](#);
- d) allow for internal combustion hydrogen vehicles which use ISO 14687 Grade F hydrogen to be filled by fuelling stations that dispense ISO 14687 Grade D hydrogen, as shown in [Table 2](#);
- e) prevent hydrogen fuelled vehicles from being filled by other compressed gas fuelling stations, including but not limited to those specified in ISO 16380, ISO 14469 and CSA NGV 1, as shown in [Table 3](#);
- f) prevent other gaseous fuelled vehicles from being filled by hydrogen fuelling stations including but not limited to those specified in ISO 16380, ISO 14469 and CSA NGV 1, as shown in [Table 3](#).

ISO/DIS 17268-2:2026(en)

Key
O: Can connect
X: Cannot connect

4.3 Nozzles and receptacles shall be well fitted and manufactured in accordance with good engineering practice.

4.4 Nozzles and receptacles shall be

- designed to minimise the possibility of incorrect assembly;
- designed to be secure against displacement, distortion, warping or other damage;
- constructed to maintain operational integrity under normal and reasonable conditions of handling and usage;
- designed with no self-evident means of defeating the safety features without specialised knowledge and tooling;
- designed for use by the general public with minimal training.

4.5 Nozzles and receptacles shall be manufactured of materials suitable and compatible for use with compressed hydrogen at the pressure and the temperature ranges to which they will be subjected as

ISO/DIS 17268-2:2026(en)

specified in 3.2, 5.9 and 6.9. All pressure bearing and wetted components shall also be made from material that is compatible with deionised water. Non-metallic material compatibility including compatibility of seal materials based on aging testing (7.14) and hydrogen resistance testing (7.15) for material malfunctions from diffusion and depressurization shall be documented by the component manufacturer or an independent third party.

4.6 The nozzle shall be connected to or disconnected from the receptacle without the use of tools.

4.7 All receptacles shall be mounted on the vehicle in compliance with the envelope requirements specified in Annex A (Figure A.1). This space is a clearance envelope to allow connecting and disconnecting the nozzle to or from the receptacle when the fuelling door is open.

4.8 Protective caps are intended to protect the receptacle or nozzle from foreign debris and shall not hold pressure. Resistance shall be appropriate to prevent inadvertent dislodging. All protective caps shall have a retainer to attach them to the receptacle, vehicle, or nozzle.

4.9 Nozzles and receptacles defined in this document can be used to fuel different types of GHLVs. The refuelling stations for these vehicles can have significantly different process limits and refuelling protocols. The nozzle and receptacle alone shall ensure that a GHLV cannot refuel at an incompatible station. If this occurs, the GHLV may be exposed to conditions outside of its intended limits, such as fuel container overheating. If this is a potential problem, the user and station manufacturer should develop additional controls to mitigate this risk.

4.10 Nozzles and receptacles shall be tested for over-pressurization in 7.13.2 and 7.13.4 to demonstrate compliance with Part I E. 81. (f) (iii) of ECE/TRANS/180/Add. 13/Amend. 1 Global Technical Regulation No. 13 (Global technical regulation on hydrogen and fuel cell vehicles).

4.11 The maximum volume of air allowed between the receptacle and nozzle after connection shall not exceed the volumes in Table 4.

Table 4 — Maximum volume of air allowed between nozzle and receptacle after connection

Pressure class	Nozzle allowable volume of air cm ³	Receptacle allowable volume of air cm ³
H35HF	30	30
H70HF	30	30

Note For the case of a hydrogen storage system containing 60 kg of compressed hydrogen, a trapped volume of 30 cm³ of air would result in a final fuel system nitrogen concentration of 0,49 ppm and an oxygen concentration of 0,15 ppm, which are both well below the maximum allowable nitrogen and oxygen concentrations for Grade D hydrogen fuel per ISO 14687.

4.12 Flow rate category

The nozzle or receptacle shall be classified into the following maximum flow rate categories shown in Table 5.

Table 5 — Maximum flow rate categories

Pressure Class	Category	Maximum flow rate g/s
H35HF	F180	180
H70HF	F300	300

ISO/DIS 17268-2:2026(en)

4.13 Pressure drop rating

The pressure drop of a nozzle or receptacle should be measured at its flow rate category using the procedure in [Annex G \(Figures G.1-G.5\)](#).

The pressure drop rating(s) should be communicated by the manufacturer through the documentation and instruction. The manufacturer should indicate whether this pressure drop has been measured with or without filters. The nomenclature of the pressure drop should be noted as the flow rate category plus P followed by the measured pressure drop in MPa (e.g., for a nozzle with a flow rate category of 180 g/s and a measured pressure drop of 2 MPa, the nomenclature is: F180-P2.).

5 Nozzles

5.1 Nozzles shall be in accordance with the dimensional requirements of [6.1](#) to ensure proper interchangeability according to [4.2](#).

5.2 Nozzles shall be one of the following three types.

- a) TYPE A — A nozzle for use with dispensing hoses that may remain fully pressurized after cessation of the fuelling process. The nozzle shall not allow gas to flow until a positive connection has been achieved. The nozzle shall be equipped with an integral valve or valves, incorporating an operating mechanism which first stops the supply of gas and safely vents the trapped gas before allowing the disconnection of the nozzle from the receptacle. The operating mechanism shall ensure the vent connection is open before the release mechanism can be operated and the gas located between the nozzle shut-off valve and the receptacle check valve is safely vented prior to nozzle disconnection.
- b) TYPE B — A nozzle for use with dispensing hoses that may remain fully pressurized after cessation of the fuelling process. A separate three-way valve connected directly, or indirectly, to the inlet of the nozzle shall be used to safely vent trapped gas prior to nozzle disconnection. The nozzle shall not allow gas to flow until a positive connection has been achieved. Venting shall be achieved prior to disconnection of the nozzle. External three-way valves shall be constructed and marked so as to indicate clearly the open, shut and vent positions.
- c) TYPE C — A nozzle for use with dispensing hoses which are depressurized (0,5 MPa and below) after cessation of the fuelling process. The nozzle shall not allow gas to flow until a positive connection has been achieved. The function of preventing flow may be controlled by the dispenser as long as it is receiving a positive connection signal from the nozzle.

5.3 Nozzles shall be designed for a life of 100 000 cycles with manufacturer specified maintenance. The three-way valve used for actuating Type B nozzles shall meet the same number of cycles as the nozzle (i.e., 100 000 cycles).

5.4 Nozzles that have been subjected to 10 over-pressurization occurrences shall be removed from service.

5.5 The act of venting, or de-pressurizing, of the connection space between all nozzle types and receptacles shall be performed prior to disconnection. A provision shall be made for the venting or de-pressurizing of all nozzle types to be directed to a safe location.

5.6 The means for attaching the nozzle to the fuel dispensing system hose shall not rely on the joint between the male and female threads for sealing, such as tapered pipe threads.

5.7 All nozzles shall fit within the envelope specified in [Annex A \(Figure A.1\)](#).

5.8 If the nozzle has means to prevent the ingress of solid matter from upstream sources, it shall be attached to the nozzle and subjected to all of the nozzle tests.
